

Major Mines of Nevada 2006

Mineral Industries in Nevada's Economy

By Doug Driesner and Alan Coyner
The Nevada Division of Minerals

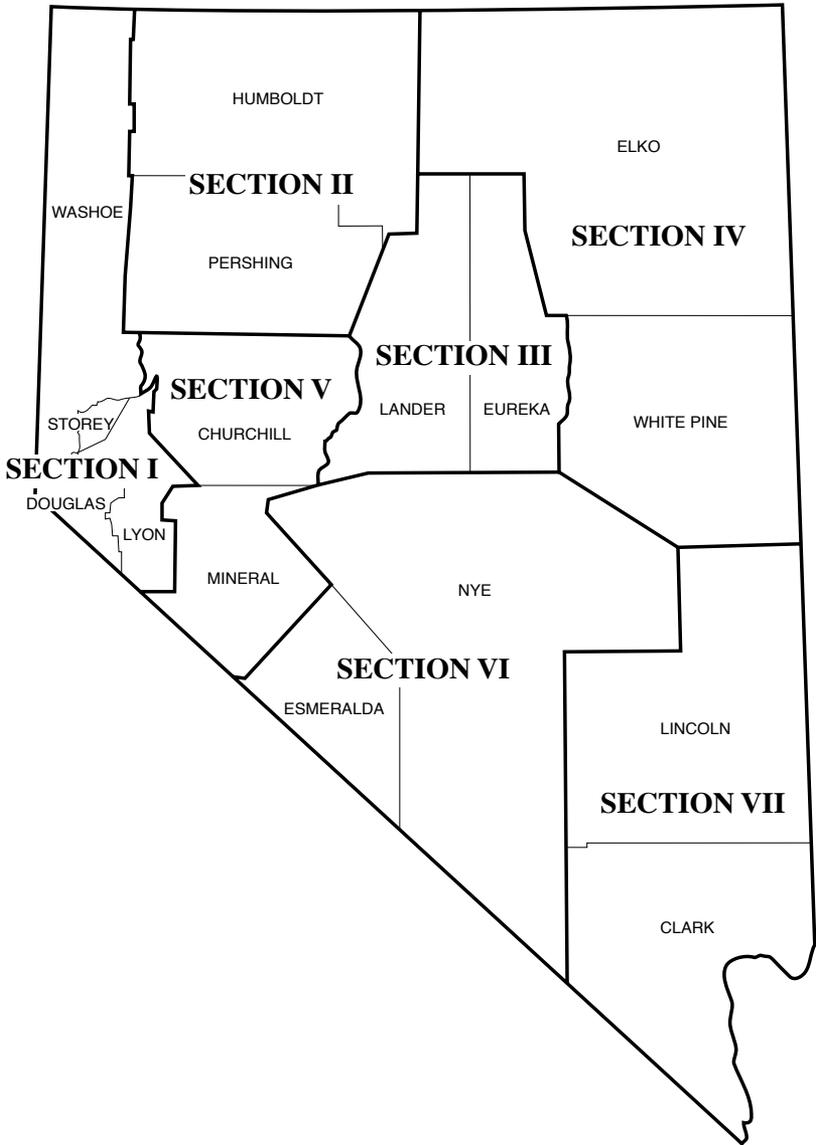

2007

This is the eighteenth of an annual series of summary reports on major mines of Nevada. Sand and gravel operations are not included. Information on employment and production for the calendar year 2006 was provided by the individual mine operators. The Nevada Division of Minerals maintains a complete register of Nevada mines. For further information, contact them at 400 W. King, Suite 106, Carson City, Nevada 89703 or call (775) 684-7040, fax (775) 684-7052, or visit their Web site at <http://minerals.state.nv.us>.

Economic Impacts of Mining in Nevada—2006

Nevada's mining industry set an all-time record in 2006 for total value of all mined commodities. The total value was about \$4.9 billion, a \$1.2 billion increase over 2005. The value was driven by gold, which contributed about \$3.8 billion, based on an average price of \$603 per troy ounce. Nevada led the nation in 2006 in the production of gold, barite, and lithium as it has for several years. Nevada's mines produced a wide variety of other mineral and energy commodities such as aggregates, copper, diatomite, dolomite, geothermal energy, lapidary and gem stones, and lime and limestone, magnesium compounds, mercury, molybdenum, oil, perlite, potassium sulfate, salt, silica sand, silver, and specialty aggregates and clays.

Production Highlights

Nevada's gold production was 6,310,000 troy ounces in 2006. While the production level is down approximately 8% from 2005, Nevada remains the nation's top gold producer with about 81% of the U.S. total. Underground operations contributed about 24% of the gold production in 2006. Silver production dropped to 8,482,000 troy ounces compared to 9,946,000 in 2005. Barite production was up to 572,000 tons in 2006, compared to 511,000 in 2005. Gypsum production was down slightly to 1,930,000 tons in 2006, compared to 2,182,000 tons in 2005. Copper production was up to 127,554,000 pounds in 2006, compared to 126,225,000 pounds in 2005. Molybdenum production resumed in Nevada and was 268,000 pounds in 2006.

Employment

According to the Nevada Department of Employment, Training, and Rehabilitation, the Nevada mining industry employed an average of 11,516 employees in 2006. The average pay for mineral industry employees during this time was \$69,387 per year, the highest average of any employment sector in the state. In addition, it is estimated that there are about 52,000 jobs in the state related to providing goods and services needed by the mining industry. Mining employment has been on a rebound the past 3 years due to more favorable prices for several mineral commodities.

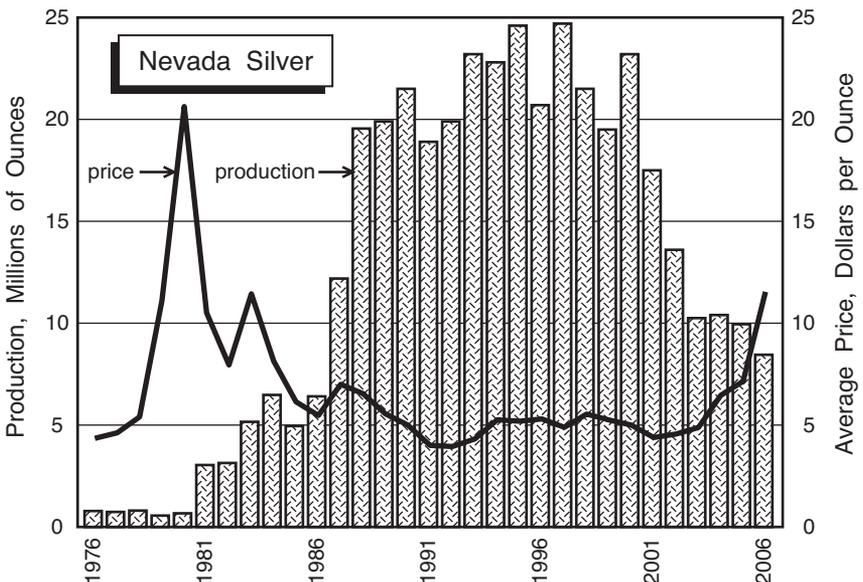

Permitting and Reclamation

Before mining can take place, plans of operation must be submitted and permits must be obtained from federal and state agencies to ensure that resources such as wildlife, air, and water are protected. Nevada and federal laws and regulations require

that lands disturbed by mining activities must be rehabilitated so they can be used for other activities once mining is completed. This process, called reclamation, returns mined areas to other productive uses such as livestock grazing, wildlife habitat, or other industrial applications. To ensure that reclamation is done, mine operators are required to post reclamation bonds that are held by government agencies. The bonds are released only after the mined area is stabilized and the reclamation goals have been met. According to the Division of Environmental Protection, approximately \$847 million in reclamation bonds are currently posted. Mine operators are proud of their efforts and are constantly seeking ways to enhance their reclamation technology.

Gold Reserves

Nevada's reported gold reserves at or near currently operating mines that can be mined at a profit under current economic conditions stood at about

84.2 million troy ounces at the end of 2006. The amount of reserves is always in a state of flux, due to some reserves being lost to production, additions of new reserves through new discoveries, and changing economic conditions. The price of gold and the cost of production are the main factors determining whether a reserve is really a reserve or just a sub-economic resource. Extensive gold resources, not currently economic, are known to exist at or near many operations. An increase in the gold price with all else being equal would mean many companies would be able to reclassify their resources into a reserve category. An increase in the cost of regulatory compliance has the same effect as a lowering of the gold price, thus increasingly complex and expensive regulations can reduce reserves. Under current conditions, the existing proven reserves are sufficient to sustain gold production at current levels for about 13 years.

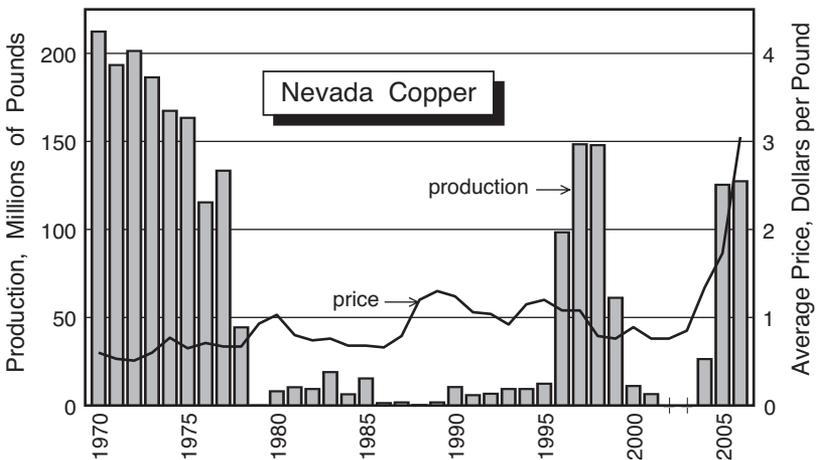

Exploration

Exploration for new deposits, particularly gold, is an ongoing effort by both the operating companies and

many others who do not operate mines in the state. Each year, the Division of Minerals conducts an exploration survey to determine the level of exploration activity and the factors that are responsible for those levels. The respondents to the latest survey indicated they spent \$164.9 million on exploration in Nevada in 2006, up from \$121.3 million in 2005. The respondents reported having 228 geologists on the payroll, up from 190 in 2005. Existence of favorable geology and commodity prices are cited as the most important factors influencing exploration levels. Exploration geologists and the drillers, assayers, and others who support their activities represent a significant positive economic impact, particularly in Nevada’s rural areas.

Minerals Other Than Gold and Silver

Minerals other than gold and silver are also important to Nevada’s economy. Copper ranked second behind gold in terms of value in 2006. Sand, gravel, and crushed stone ranked a close third in terms of value, and are critical to the building of the state’s infrastructure. Industrial minerals such as barite, diatomite, dolomite, gypsum, limestone,

lithium compounds, magnesite, perlite, salt, and specialty clays are produced in this state.

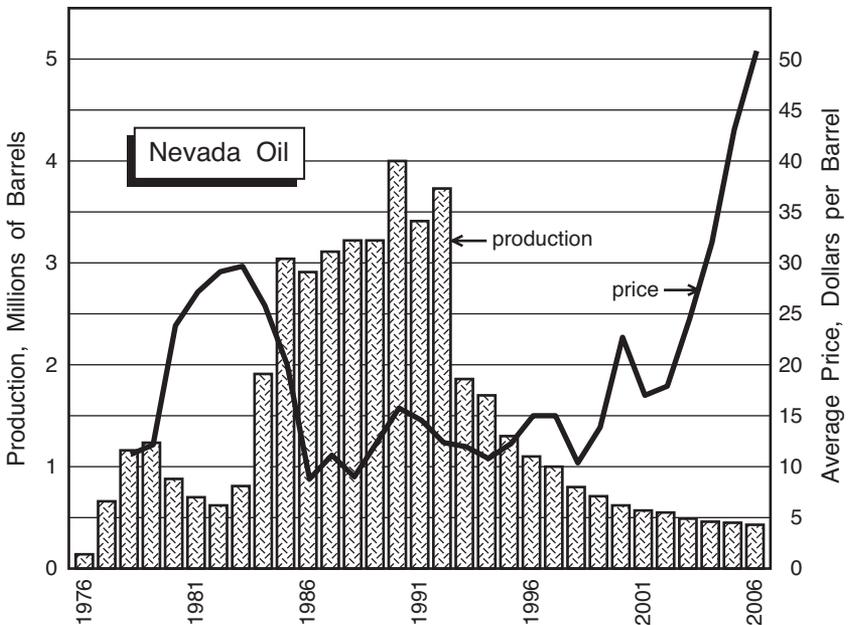

Oil and gas exploration and production are relatively minor when compared to mining, but are nevertheless important to the economy of east-central Nevada. In oil field terms, Nevada is considered a frontier, meaning its potential is yet to be realized. Oil production in 2006 was about 426,000 barrels (42 gallons per barrel).

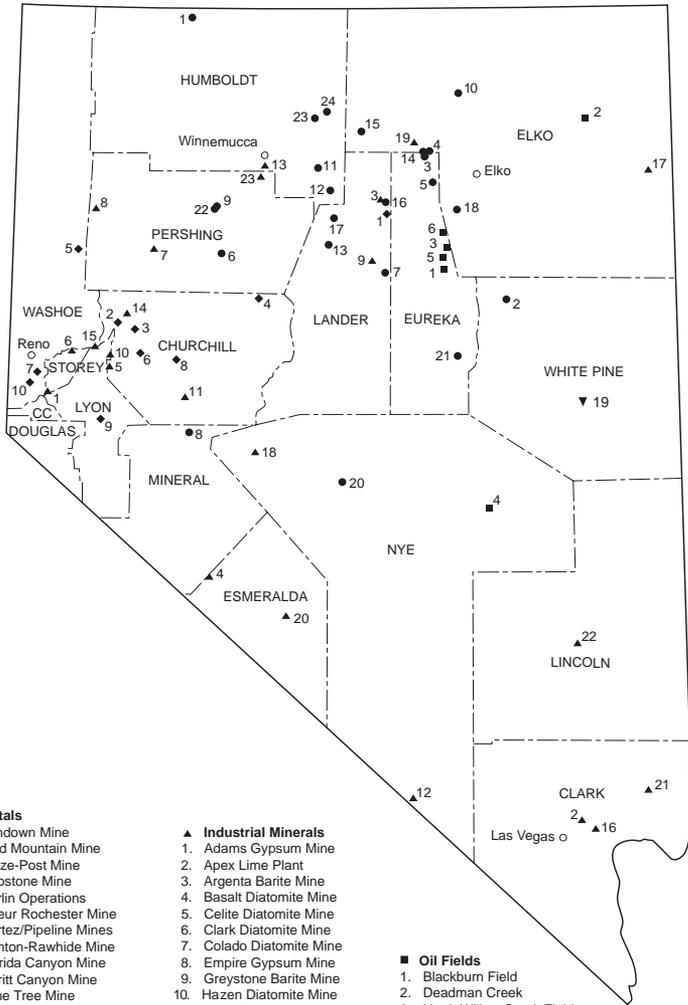

Nevada is rich in geothermal resources and is second only to California in the production of geothermal power. Currently, Nevada has 15 plants at 10 locations that sold approximately 1.3 million megawatt hours of electricity in 2006. This is enough to power about 75,000 typical homes. Geothermal heat is also used for a variety of commercial, domestic, and public applications in Nevada. Schools in Elko County and homes

in Lincoln and Washoe Counties are examples of public and private facilities using this renewable energy resource.

Conclusion

With a calculated value of about \$5.1 billion, Nevada's mineral industry continued to be a major economic force in the state in 2006. This situation should continue for many years to come. Challenges will exist, as they always have, but Nevada's mineral reserves and the potential to add to them will spur the creativity of the mineral industry. Prices of many mineral commodities have improved in recent years, allowing companies to increase their exploration and development efforts. The continued development of new projects will assure that the mining industry will remain strong in the future.
