FOREWORD

Personal Health Choices is a joint publication of the Center for Health Information Analysis (CHIA) and the Department of Health and Human Services, Nevada State Health Division, Bureau of Health Statistics, Planning and Emergency Response. The report presents Acute Care Hospital Inpatient Discharge Billing Records data for 75 common medical and surgical diagnoses by DRG (Diagnosis-Related Group) as reported by 34 of Nevada's acute care hospitals that discharged patients within the period of 2007 to 2011.

These data are available through the standard Uniform Billing form, which is utilized by hospitals to bill for their hospital charges. These data include patients who were admitted to a hospital as an inpatient, but do not include patients who were treated and released from the emergency room. It includes information about patients discharged from non-federal acute care hospitals in Nevada. These data identify billed charges, not the actual payments received by the hospital.

The data were compiled by CHIA using information from inpatient hospital billing records. This information was gathered and analyzed as part of a contractual agreement between the Department of Health and Human Services and the University under the authority granted in Section 439B of the Nevada Revised Statutes.

INTRODUCTION

This twenty fourth edition of Personal Health Choices compares 34 of Nevada's acute care hospitals with respect to 75 common medical diagnoses and surgical procedures, defined by Diagnosis Related Groups (DRGs: see below). The definitions to all DRG's can be found on the narrative page for each DRG. Each diagnosis and procedure in this publication may be based on an individual DRG or multiple related DRGs.

THE DIAGNOSIS RELATED GROUP (DRG) SYSTEM

Diagnosis Related Group (DRG), is a classification system that is based on principal and secondary disease diagnoses, medical and surgical procedures, complications, comorbidities (coexisting conditions), age and discharge status. The DRG system is complex in its construction, and is based upon documentation in the patient's medical record. DRGs are divided into 25 exclusive categories referred to as major diagnostic categories (MDCs). DRGs enable hospitals to recover the appropriate reimbursement for services rendered, evaluate the quality of care and assist in evaluating utilization of services. The DRG system's groups classify patients with similar utilization of hospital resources and length of stay patterns. Each DRG represents the average resources needed to treat patients grouped to that DRG compared to the national average of resources to treat all Medicare patients. Hospitals are reimbursed at a flat rate based on the theory that patients with similar illnesses undergoing similar procedures will require similar care. The primary outcome of the DRG system is that the more efficiently a hospital delivers care, the greater its operating margin will be.

INFORMATION LEVEL

Personal Health Choices is intended as a source of information regarding the billed charges of acute care hospitals in Nevada, and should not be construed as a definitive guide for selecting a hospital in order to receive inpatient medical care. The financial information in this report is based on billed charges rather than the amount actually collected on discharged patients per DRG. Billed charges and collected charges can differ significantly. This report provides the reader information about one component of healthcare pricing - inpatient hospitalization. Hospital outpatient services as well as professional physician and other non-hospital inpatient ancillary healthcare services are not covered in this report.

CREDIT DUE: Google Web was extensively used to obtain definitions for medical terms. This can be accessed by typing, 'define: term' in the Google search box. Also <http://medical-dictionary.thefreedictionary.com/>

FACTORS TO CONSIDER IN REVIEWING THIS REPORT

The information provided in this report is formatted so as to present narrative and tabular data on the first page and detailed tabular data on the second. This report covers a five-year trend line for DRG-related data. DRG's are sometimes broken down by age factors and/or presence of comorbidity. Comorbidity or comorbid conditions are defined as two or more coexisting medical conditions.

The first page of each selected DRG presents gender and age breakdowns of the overall hospital inpatient population, factored by the total number of discharges, average length of hospital stay and average billed charges. The age categories consist of 0-17, 18-35, 36-49, 50-64, and 65+. These age categories were selected to best illustrate the impact of the disease diagnoses and medical and surgical procedures on the populations affected. The narrative information on the first page for each DRG is based on the available data and may contain information on specific diagnoses and surgical procedures involved in the treatment of the patient. These diagnoses and procedures may not always be directly related to the primary ailment. The second page examines specific hospitals in Clark, Washoe and the Rural counties. with regard to total discharges, average length of stays, and average billed charges.

It should be noted that, when comparing hospitals as to average length of stay and billed charges, information based on small numbers of cases cannot provide a reliable statistical base upon which information can reflect a given hospital's experience. Further, physician charges (including those of surgeons) are normally separate from hospital charges, except in rural areas where some physician services -- such as radiology, anesthesia, and laboratory tests -- may be included in the hospital charges.

Beginning October 1, 2007 the DRG numbering was changed. In order to do a clean crosswalk between the old number system and the new, this edition of Choices uses multiple, related DRGs on many of the pages. The "Report List" tabs mention DRG use.

ERRATA: This printing of Health Choices corrects an error from the printing of May 2012. Due to a sorting error, several facility names were listed out of order and the data shown for those facilities were swapped with one another. Southern Hills, Spring Valley, and the three St. Rose facilities were the ones affected.

HOSPITAL NAME CHANGES

Incline Village was previously known as Tahoe Hospital, then Tahoe Forest

Northeastern was previously known as Elko General

North Vista was previously known as Lake Mead

Renown Regional was previously known as Washoe Medical

Renown South Meadows was previously known as Washoe Village, then Washoe South Meadows

GENERAL ACUTE CARE HOSPITALS

Hospital Name	Address	Phone	Beds	County
Battle Mountain General Hospital	535 Humboldt St., Battle Mountain, NV 89820	(775) 635-2550	25	Lander

Degenerative Nervous System Disorders

Diagnoses: that frequently accompanied degenerative nervous system disorders were: 1) Unspecified hypertension (4019), 2) Alzheimer's disease (3310), 3) Dementia with behavioral disturbance (29411), 4) Dementia without behavioral disturbance (29410), 5) Depressive disorder NEC (311).

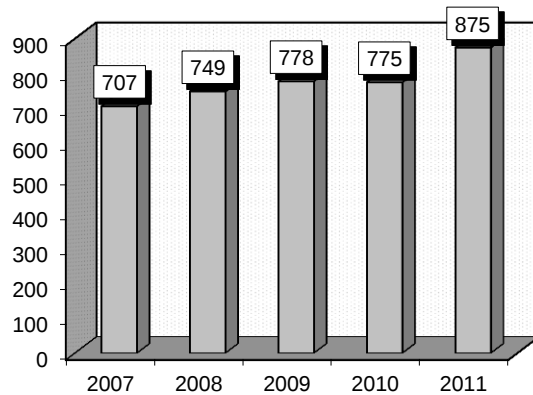

Definitions: Hypertension: Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

Alzheimer's disease: A progressive mental deterioration characterized by confusion, disorientation, restlessness, and hallucinations. Only palliative treatment is available.

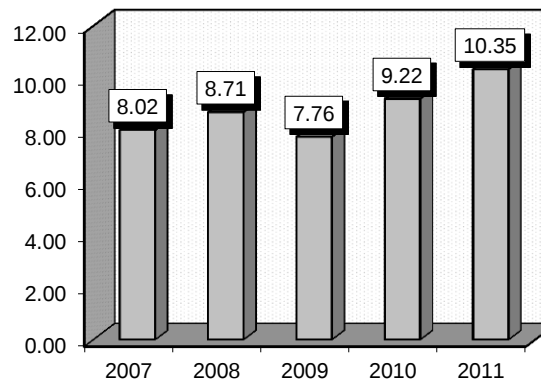

Dementia: A progressive organic mental disorder characterized by chronic confusion, disorientation, stupor, impaired judgment and impulses. Organic forms of dementia are generally considered irreversible, progressive and incurable. However, conditions that cause the decline may be treatable or partially reversible. **Depression:** An abnormal emotional state characterized by exaggerated feelings of sadness, dejection, worthlessness, emptiness and hopelessness that are out of proportion to reality.

Multiple Sclerosis & Cerebellar Ataxia

Diagnoses and Procedures: that frequently accompanied multiple sclerosis & cerebellar ataxia were: 1) Neuromyelitis optica (3410), 2) Demyelinating disease of central nervous system, unspecified (3419), 3) Spinal tap (331), 4) Injection or infusion of gamma globulin (9914), 5) Venous catheterization for renal dialysis (3895), 6) Insertion of totally implantable vascular access device [VAD] (8607)

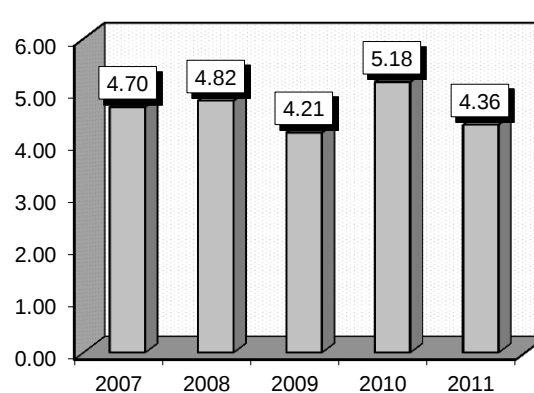

Definitions: **Sclerosis:** An inflammatory disease of the myelin sheaths encasing the nerves. **Ataxia:** A lack of coordination of muscle movements. **Neuromyelitis:** A disease that affects the nerves through a deterioration of the myelin sheath. It can affect the optic nerves causing pain and loss of vision. It can also affect the spinal cord and result in a weakness or numbness in the arms and legs. **Myelin:** A fatty substance that surrounds and protects the nerves from short circuiting. **Demyelinating disease:** Any disease of the nervous system that damages or destroys the myelin sheath. **Spinal Tap:** A medical procedure in which a needle is inserted into the lumbar (lower) region of the spinal cord and cerebrospinal fluid is extracted. The fluid is subsequently examined for the presence of disease. **Gamma Globulin:** Also known as immunoglobulin is blood plasma containing various proteins including antibodies that help fight infections and disease. **Renal Dialysis:** The filtration of blood through an artificial kidney to remove waste products.

Acute Ischemic Stroke With Use Of Thrombolytic Agent

Diagnoses and Procedures: that frequently accompanied ischemic stroke were: 1) Cerebral artery occlusion, unspecified with cerebral infarction (43491), 2) Cerebral embolism with cerebral infarction (43411), 3) Occlusion and stenosis of carotid artery with cerebral infarction (43311), 4) Cerebral thrombosis with cerebral infarction (43401), 5) Injection or infusion of thrombolytic agent (9910).

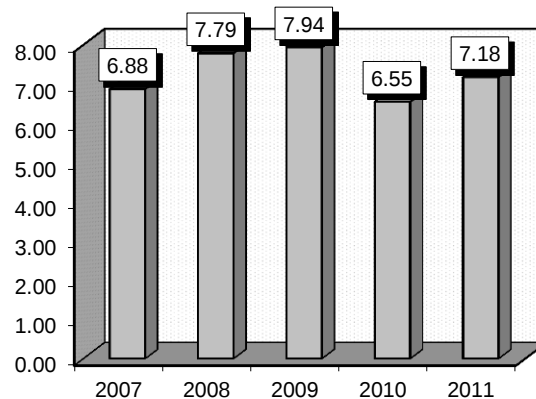

Definitions: **Ischemic Stroke:** The interruption of blood flow to a part of the brain caused by a blood clot. **Ischemia:** Localized anemia to a body part caused by restricted blood flow. **Anemia:** A deficiency of red blood cells. **Thrombosis:** The formation or presence of a thrombus, blood clot. **Embolism:** The occlusion or blockage of a blood vessel. **Infarction:** A section or area of muscular tissue that is dead or dying due to insufficient blood flow. **Stenosis:** An abnormal narrowing of an artery. **Thrombolytic Agent:** A pharmaceutical agent that is used to break up or dissolve blood clots that are diminishing or blocking blood flow to the heart.

Intracranial Hemorrhage Or Cerebral Infarction

Diagnoses and Procedures: that frequently accompanied intracranial hemorrhage were: 1) Cerebral artery occlusion, unspecified with cerebral infarction (43491), 2) Cerebral embolism with cerebral infarction (43411), 3) Occlusion and stenosis of carotid artery with cerebral infarction (43311), 4) Subdural hemorrhage (4321), 5) Subarachnoid hemorrhage (430), 6) Diagnostic ultrasound of heart (8872), 7) Arteriography of cerebral arteries (8841), 8) Insertion of endotracheal tube (9604), 9) Magnetic resonance imaging (MRI) of brain and brain stem (8891).

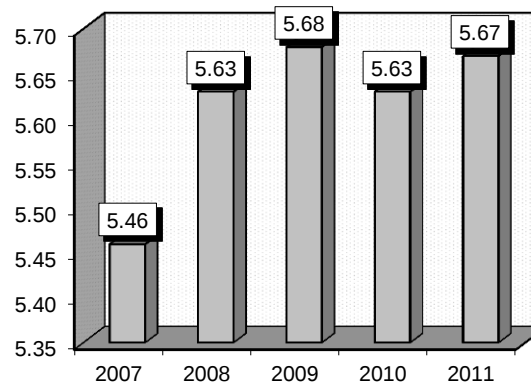

Definitions: **Occlusion:** Blockage. The interruption of blood flow. **Hemorrhage:** Profuse bleeding. **Arteriography:** An x-ray exam of an artery after the injection of a contrast medium. **Thrombosis:** The formation or presence of a thrombus, blood clot. **Embolism:** The occlusion or blockage of a blood vessel. **Infarction:** An section or area of muscular tissue that is dead or dying due to insufficient blood flow. **Stenosis:** An abnormal narrowing of a artery. **Endotracheal Tube:** A catheter that is inserted into the trachea through the mouth or nose. Its purpose is to provide oxygen or to clear away mucus. **Trachea:** Windpipe.

Transient Ischemia

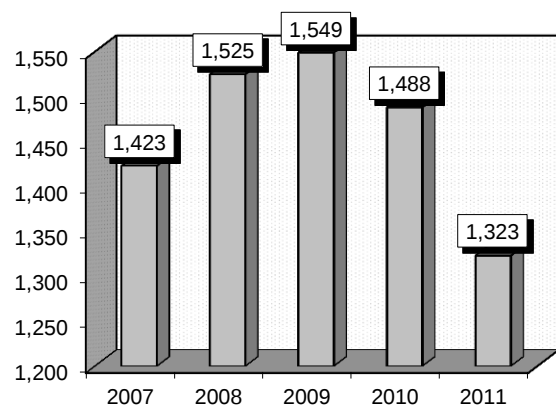

Diagnoses and Procedures: that frequently accompanied transient ischemia were: 1) Unspecified transient cerebral ischemia (4359), 2) Other specified transient cerebral ischemias (4358), 3) Diagnostic ultrasound of heart (8872), 4) Arteriography of cerebral arteries (8841), 5) Magnetic resonance imaging of brain and brain stem (8891).

Definitions: **Ischemic Stroke:** The interruption of blood flow to a part of the brain caused by a blood clot. **Ischemia:** Localized anemia to a body part caused by restricted blood flow. **Transient Ischemic Attack (TIA):** Temporary stroke like symptoms caused by a brief lack of blood flow to a part of the brain - also called mini-strokes.

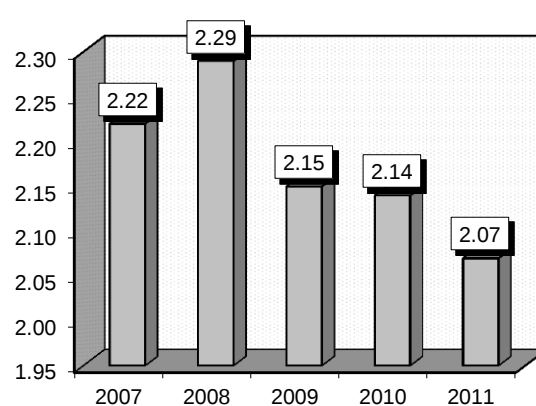

Arteriography: An x-ray exam of an artery after the injection of a contrast medium.

Concussion

Diagnoses and Procedures: that frequently accompanied concussion were: 1) Concussion with loss of consciousness of unspecified duration (8505), 2) Concussion, with loss of consciousness of 30 minutes or less (85011), 3) Concussion with no loss of consciousness (8500), 4) Closure of skin and subcutaneous tissue of other sites (8659), 5) Continuous invasive mechanical ventilation for less than 96 consecutive hours (9671).

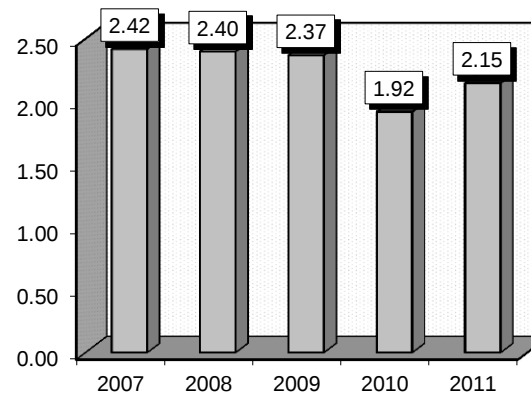

Definitions: **Concussion:** A violent blow to the head causing temporary loss of function or consciousness. **Subcutaneous Tissue:** Located just beneath the skin.

Major Chest Procedures

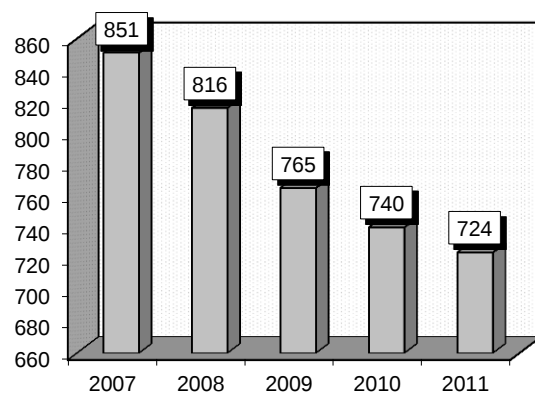

Procedures: that frequently accompanied major chest procedures were: 1) Lobectomies of the lung (324), 2) Decortication of the lung (3451), 3) Fiber-optic bronchoscopy (3322), 4) Other local excision or destruction of a lesion or tissue of the lung, and insertion of intercostal catheter (chest tube) for drainage (3404), 5) Open lung biopsy (3328).

Definitions: **Bronchoscopy:** Evaluation of all the major airways through a scope (a thin tube with a light on the end). **Thoroscopy:** Surgery on the chest cavity through small incisions, aided by camera-mounted scopes. This is usually done for lung biopsies, treatment of fluid in the chest, or to treat a pneumothorax. **Wedge resection:** The surgical removal of a small wedge shaped portion of the lung. **Lobectomy:** Surgical removal of a lobe or section of the lung. **Decortication:** Removal of portion of the surface of the lung. **Intercostal:** The space between two ribs.

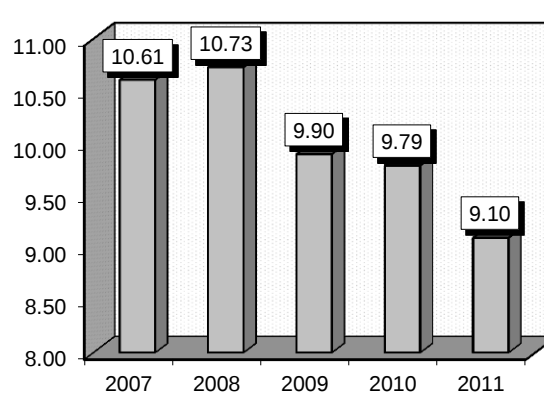

Comment: This procedure includes surgery on structures within the chest cavity, excluding the heart. The most common procedures are those involving the lungs and the esophagus.

Respiratory Infections & Inflammations

Diagnoses: that frequently accompanied respiratory infections & inflammations were: 1) Pneumonia due to inhalation of food or vomitus (5070), 2) Chronic airway obstruction (496), 3) Hypoxemia (79902), 4) Dysphagia (7872), 5) Pneumonia due to staphylococcus (4824), 6) Gastroesophageal reflux (53081), 7) Cystic fibrosis with pulmonary manifestations (27702).

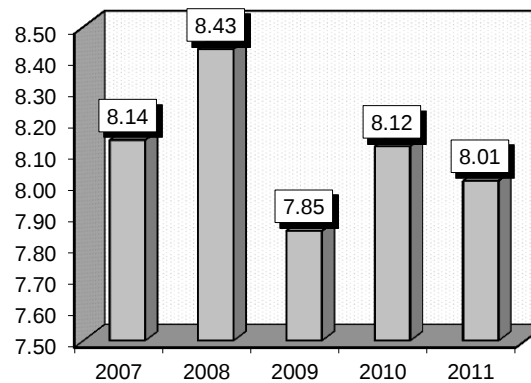

Definitions: **Pneumonia:** An acute inflammation of the lungs. **Pseudomonas:** A genus of gram-negative bacteria that includes several free-living species in soil and water and some opportunistic pathogens. **Hypoxemia:** Low oxygen levels in the blood. **Dysphagia:** Difficulty swallowing. **Staphylococcus:** An infection caused by any one of several pathogenic species. Staphylococcus pneumonia often follows other viral disease and may be associated with chronic or debilitating illness. **Pathogen:** A microorganism capable of producing disease. **Aspiration pneumonia:** An inflammatory condition of the lungs and bronchi caused by inhalation of foreign material or vomitus. **Cystic fibrosis:** Is a hereditary disease that affects the lungs, digestive system, sweat glands, and male reproductive organs.

Respiratory Neoplasms

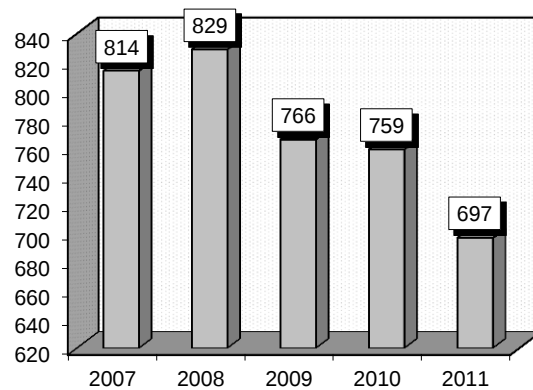

Diagnoses: that frequently accompanied respiratory neoplasms were: 1) Hypertension (4019), 2) History of tobacco use (V1582), 3) Tobacco use disorder (3051), 4) Pneumonia - organism not elsewhere specified (486), 5) Malignant neoplasm - bronchial tube (1629).

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Neoplasm:** An abnormal and uncontrolled growth of tissue; a tumor. **Malignant:** An uncontrolled growth of cells that disrupt normal cells; cancer. **Pneumonia:** An acute inflammation of the lungs. **Hypoxia:** Inadequate oxygenation characterized by an high heart rate, high blood pressure, dizziness and mental confusion. **Cyanosis:** A bluish discoloration of the skin caused by an excess of deoxygenated blood. **Bronchiectasis:** An abnormal condition of the bronchial tree characterized by irreversible dilation and destruction of the bronchial walls.

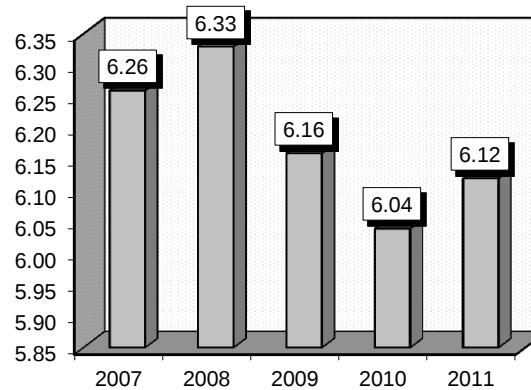

Comment: The lungs consist of bronchial tubes and lobes. During respiration air enters the bronchial tubes. These tubes continuously branch into smaller tubules called bronchioles. There are 5 sections or lobes within the lung. The right lung contains three lobes: upper, middle and lower. The left lung contains two: upper and lower. Neoplasms may be found in any part of the lung, from the bronchial tubes (ICD-9 1629) to the lobes (ICD-9 1623).

Major Chest Trauma

Diagnoses: that frequently accompanied major chest trauma were: 1) Hypertension (4019), 2) Fracture; closed; one rib (80701), 3) Fracture; closed; two ribs (80702), 4) Fracture; closed; three ribs (80703), 5) Tobacco use disorder (3051), 6) Injury; lung, without mention of open wound into thorax; contusion (86121), 7) Pulmonary collapse (5180).

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

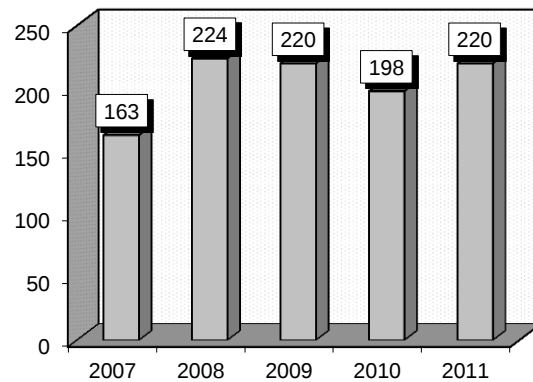

Fracture: A partial or complete break of a body part, usually a bone. **Thorax:** The part of the human torso between the neck and the diaphragm. **Diaphragm:** The thin muscle below the lungs and heart that separates the chest from the abdomen. **Contusion:** Another name for a bruise.

Comment: Major chest trauma is normally the result of an accident, such as an automobile accident (E8495). The resulting damage may be broken ribs or sternum, a collapsed or damaged lung or other chest organs.

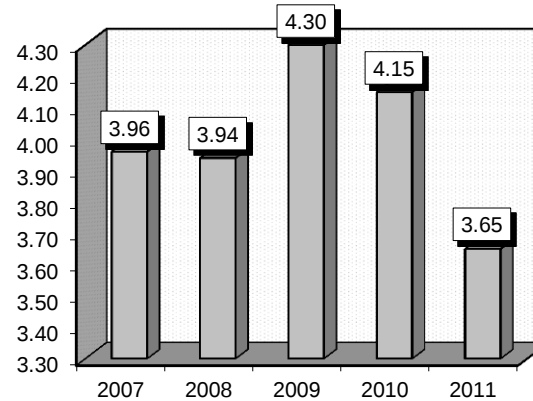

Note: Throughout this publication you may find a number of ailments accompanied by tobacco use disorder and/or hypertension. These often do not have a direct correlation to the ailment, but are left in to demonstrate to the reader their high frequency.

Pulmonary Edema & Respiratory Failure

Diagnoses: that frequently accompanied pulmonary edema and respiratory failure were: 1) Acute respiratory failure (51881), 2) Hypertension (4019), 3) Chronic bronchitis with acute exacerbation (49121), 4) Congestive heart failure, unspecified (4280), 5) Pneumonia, organism unspecified (486).

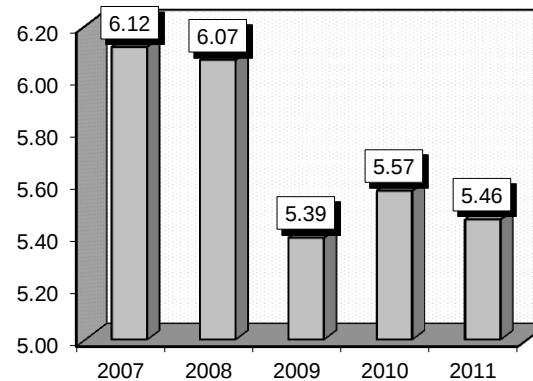

Definitions: **Edema:** Swelling caused by an accumulation of fluid within body tissues. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Bronchitis:** An inflammation of mucous membranes of the bronchial tubes. It is accompanied by a persistent cough, and phlegm. **Chronic obstructive pulmonary disease:** A progressive and irreversible condition characterized by diminished inspiratory and expiratory capacity of the lungs. It includes asthma, chronic bronchiectasis, chronic bronchitis and emphysema. The condition is aggravated by cigarette smoking and air pollution. **Exacerbation:** An increase in the seriousness of a disease or disorder as marked by greater intensity in the signs or symptoms of the patient being treated. **Hypoxia:** Inadequate oxygenation characterized by an high heart rate, high blood pressure, dizziness and mental confusion. **Cyanosis:** A bluish discoloration of the skin caused by an excess of deoxygenated blood. **Bronchiectasis:** An abnormal condition of the bronchial tree characterized by irreversible dilation and destruction of the bronchial walls. **Pneumonia:** An acute inflammation of the lung parenchyma accompanied by congestion.

Chronic Obstructive Pulmonary Disease

Diagnoses: that frequently accompanied chronic obstructive pulmonary disease were: 1) Chronic obstructive bronchitis with acute exacerbation (49121), 2) Hypertension (4019), 3) Tobacco use disorder (3051), 4) History of tobacco use (V1582), 5) Congestive heart failure (4280).

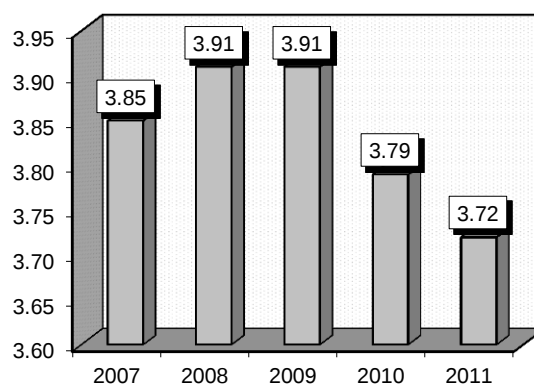

Definitions: Chronic obstructive pulmonary disease: A progressive and irreversible condition characterized by diminished inspiratory and expiratory capacity of the lungs. It includes asthma, chronic bronchiectasis, chronic bronchitis and emphysema. The condition is aggravated by cigarette smoking and air pollution. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Exacerbation:** An increase in the seriousness of a disease or disorder as marked by greater intensity in the signs or symptoms of the patient being treated. **Asthma:** A respiratory disorder characterized by recurring episodes of breathing difficulty, wheezing on expiration and/or inspiration caused by constriction of the bronchi, coughing and thick bronchial secretions. **Status asthmaticus:** An acute, severe, and prolonged asthma attack. Hypoxia, cyanosis and unconsciousness may follow, and the attack may be fatal. **Hypoxia:** Inadequate oxygenation characterized by an high heart rate, high blood pressure, dizziness and mental confusion. **Cyanosis:** A bluish discoloration of the skin caused by an excess of deoxygenated blood. **Bronchiectasis:** An abnormal condition of the bronchial tree characterized by irreversible dilation and destruction of the bronchial walls.

Simple Pneumonia & Pleurisy

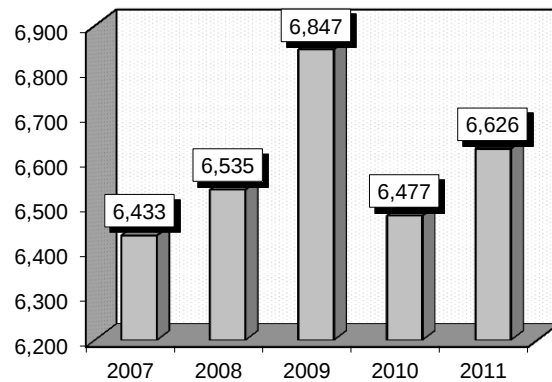

Diagnoses: that frequently accompanied simple pneumonia and pleurisy were: 1) Hypertension (4019), 2) Congestive heart failure, unspecified (4280), 3) Tobacco use disorder (3051), 4) Chronic airway obstruction (496), 5) Chronic bronchitis with acute exacerbation (49121), 6) Hypoxemia (79902), 7) Asthma (49390), 8) Otitis Media (3829), 9) Pneumonia due to respiratory syncytial virus (4801), 10) Acute bronchiolitis due to other infectious organisms (46619).

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

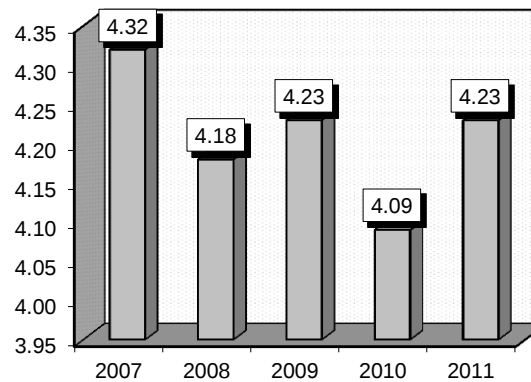

Pneumonia: An acute inflammation of the lungs, often caused by inhalation of the species streptococcus pneumoniae. The alveoli and bronchioles of the lungs become plugged with fibrous secretions. **Alveoli:** A small outpouching in the lungs through which gas exchanges from the pulmonary capillary blood. **Bronchioles:** A small airway of the respiratory system extending from the bronchi into the lobes of the lung. **Pleurisy:** Inflammation of the membrane enclosing the lung. **Bronchitis:** An inflammation of mucous membranes of the bronchial tubes. It is accompanied by a persistent cough, and phlegm. **Exacerbation:** An increase in the seriousness of a disease or disorder as marked by greater intensity in the signs or symptoms of the patient being treated. **Hypoxemia:** Low oxygen levels in the blood. **Asthma:** A respiratory disorder characterized by recurring episodes of breathing difficulty, wheezing on expiration and/or inspiration caused by constriction of the bronchi, coughing and thick bronchial secretions **Otitis Media:** Infection and inflammation of the middle ear space and eardrum.

Bronchitis & Asthma

Diagnoses: that frequently accompanied bronchitis and asthma were: 1) Hypertension (4019), 2) Hypoxemia (79902), 3) Tobacco use disorder (3051), 4) Diabetes Mellitus without mention of complication (25000), 5) Hypopotassemia (2768), 6) Obesity (27800), 7) Acute bronchiolitis due to respiratory syncytial virus (46611), 8) Otitis Media (3829), 9) Pneumonia (486), 10) Dehydration (27651), 11) Acute upper respiratory infections of multiple or unspecified sites (4659).

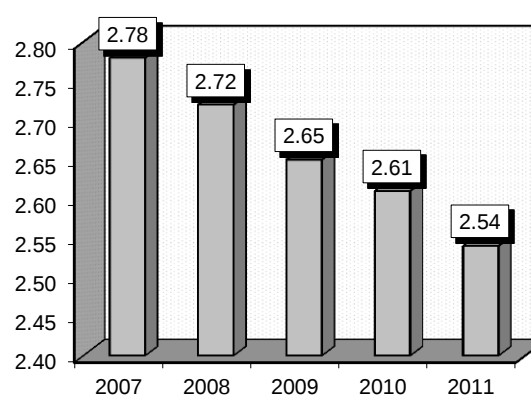

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hypoxemia:** Low oxygen levels in the blood. **Diabetes Mellitus:** High blood sugar resulting from low levels of insulin or insulin resistance. **Hypopotassemia:** Disorder of fluid, electrolyte, and acid-base balance. **Bronchitis:** An acute or chronic inflammation of the mucous membranes of the tracheobronchial tree. Acute bronchitis is characterized by a productive cough, fever, increased mucus secretion and back pain. Chronic bronchitis is a common debilitating pulmonary disease, characterized by greatly increased production of mucus by the glands of the trachea and bronchi and results in a productive cough for at least 3 months of the year for more than two consecutive years. **Asthma:** A respiratory disorder characterized by recurring episodes of breathing difficulty, wheezing on expiration and/or inspiration caused by constriction of the bronchi, coughing and thick bronchial secretions. **Asphyxia:** Severe lack of oxygen leading to loss of consciousness and possibly death. **Bronchiolitis:** Acute viral infection of the lower respiratory tract, primarily in infants less than 18 months of age.

Cardiac Valve & Other Major Cardiothoracic Procedures

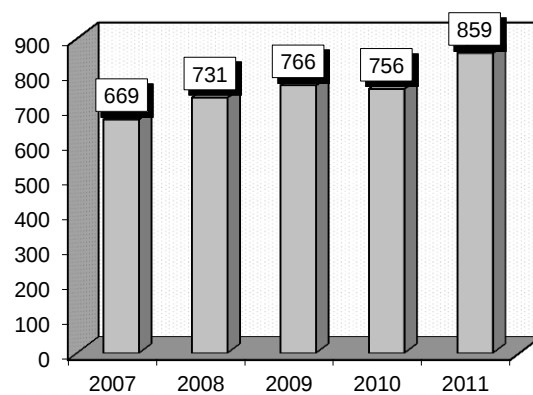

Procedures: that frequently accompanied cardiac valve & other major cardiothoracic procedures were: 1) Coronary arteriography using two catheters (8855-6), 2) Left heart cardiac catheterization (3722), 3) Replacement of aortic valve with tissue graft (3521), 4) Angiocardiology (885), 5) Monitoring of cardiac output (8967-8), 6) Transfusion (9904-9), 7) Aortocoronary bypass (3610-4).

Definitions: **Coronary:** Related to arteries that supply blood and nutrients to the heart. **Aorta:** The largest artery in the body. It carries oxygen-rich blood away from the heart to vessels that reach the rest of the body. **Arteriography:** A procedure to x-ray arteries. The arteries can be seen because of an injection of a dye that outlines the vessels on an x-ray. **Catheter:** A thin, flexible, hollow tube through which fluids enter or leave the body. **Angiocardiology:** An x-ray method using dye in the bloodstream to show the dimension of the heart. X-ray examination of the heart and great blood vessels that follows the course of an opaque fluid which has been injected into the blood stream.

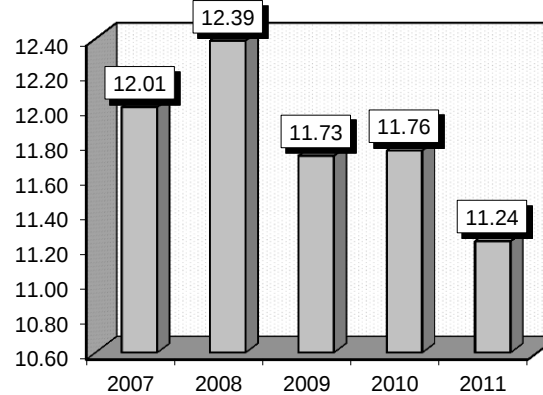

Transfusion: Replacing blood or blood components a body has lost in surgery, or through an accident.

Coronary Bypass With PTCA

Procedures: that frequently accompanied cardiac bypass with PTCA were: 1) Coronary arteriography (8855-6), 2) Cardiac catheterization (3721-2), 3) Replacement of aortic valve with tissue graft (3521), 4) Angiocardiology (8850-4), 5) Mammary coronary bypass (3615-6), 6) Aortocoronary bypass (3610-4).

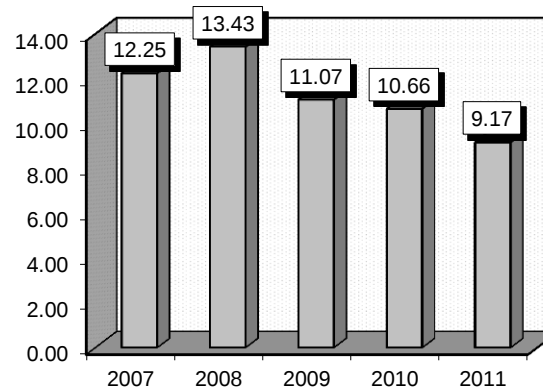

Definitions: **PTCA:** A technique to treat heart disease and chest pain by using angioplasty in the coronary arteries to permit more blood flow into the heart. **Angioplasty:** A procedure in which a special catheter with an inflatable balloon at one end is used to open blocked coronary arteries. **Coronary:** Related to arteries that supply blood and nutrients to the heart. **Aorta:** The largest artery in the body. It carries oxygen-rich blood away from the heart to vessels that reach the rest of the body. **Arteriography:** A procedure to x-ray arteries. The arteries can be seen because of an injection of a dye that outlines the vessels on an x-ray. **Catheter:** A thin, flexible, hollow tube through which fluids enter or leave the body. **Angiocardiology:** An x-ray method using dye in the bloodstream to show the dimension of the heart. X-ray examination of the heart and great blood vessels that follows the course of an opaque fluid which has been injected into the blood stream. **Angiocardiology:** An x-ray method using dye in the bloodstream to show the dimension of the heart.

Coronary Bypass

Diagnoses and Procedures: that frequently accompanied coronary bypass were: 1) Coronary atherosclerosis of native coronary artery (41401), 2) Subendocardial infarction, initial episode of care (41071), 3) Acute myocardial infarction (AMI) (41001-11), 4) (Aorto)coronary bypass of two coronary arteries (3612), 5) (Aorto)coronary bypass of three coronary arteries (3613), 6) (Aorto)coronary bypass of four or more coronary arteries (3614), 7) (Aorto)coronary bypass of one coronary artery (3611) .

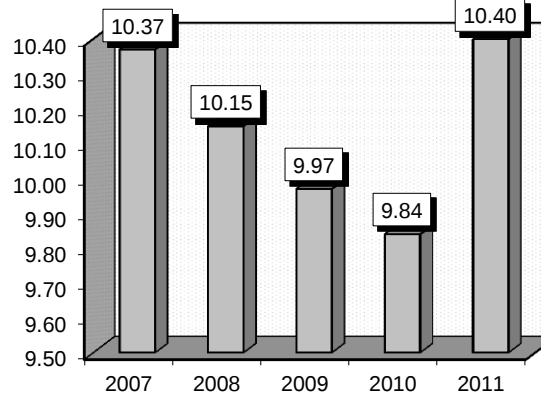

Definitions: Coronary Bypass: When one or more coronary arteries are blocked, said arteries are bypassed through the grafting of a healthy artery from another part of the body. **Atherosclerosis:** A build up of plaques within the arteries. These plaques consist of cholesterol and lipids (fats). **Subendocardial:** Located under the endocardium which is a membrane that lines the interior of the heart. **Myocardial Infarction:** A heart attack.

Major Cardiovascular Procedures

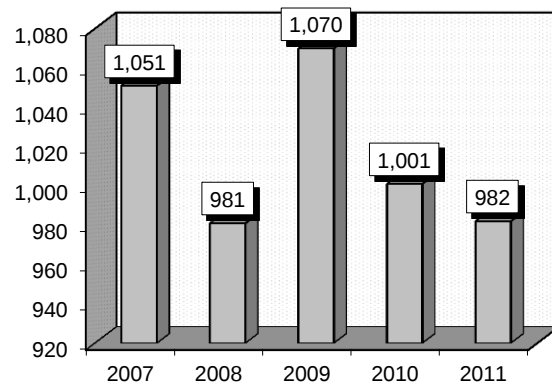

Procedures: that frequently accompanied major cardiovascular procedures were: 1) Implant of pulsation balloon (3761), 2) Coronary arteriography (8855-6), 3) Cardiac catheterization (3721-2), 4) Aorta-iliac-femoral bypass (3925), 5) Resection of abdominal aorta with replacement (3844), 6) Aortography (8842), 7) Angioplasty or atherectomy of non-coronary vessel (3950).

Definitions: **Cardiovascular disease:** Any abnormal condition characterized by dysfunction of the heart and blood vessels. **Atherosclerosis:** Yellowish plaques of cholesterol, other lipids and cellular debris in the inner layers of the walls of arteries. **Cardiac catheterization:** A diagnostic procedure in which a catheter is introduced into a large vein and threaded through the circulatory system to the heart. **Bypass:** A procedure to divert the flow of blood thereby bypassing a narrowing or blockage in a blood vessel. **Aneurysm:** A localized dilation of the wall of a blood vessel. **Arteriography:** Radiologic visualization of arteries after a radioopaque contrast medium is introduced into the bloodstream. **Catheter:** A hollow flexible tube that can be inserted into a vessel or cavity of the body. **Angioplasty:** A procedure in which a special catheter with an inflatable balloon at one end is used to open blocked coronary arteries.

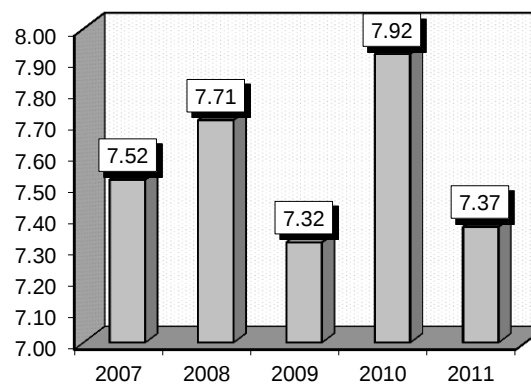

Comment: Cardiovascular procedures include (but are not limited to) diagnostic cardiac catheterization, coronary artery bypass graft procedures, cardiac pacemaker procedures, and heart valve procedures.

Permanent Cardiac Pacemaker Implant

Diagnoses and Procedures: that frequently accompanied permanent cardiac pacemaker implants were: 1) Sinoatrial node dysfunction (42781), 2) Atrioventricular block, complete (4260), 3) Other specified cardiac dysrhythmias (42789), 4) Atrial fibrillation (42731), 5) Initial insertion of transvenous leads [electrodes] into atrium and ventricle (3772), 6) Initial insertion of dual-chamber device (3783), 7) Initial insertion of transvenous lead [electrode] into ventricle (3771) .

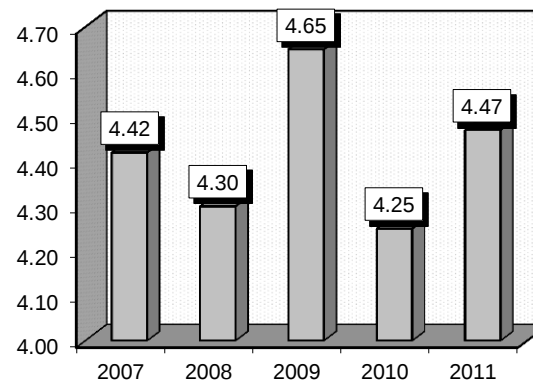

Definitions: **Sinoatrial node** : Specialized heart muscle fibers that are located in the back, right of the heart. These muscles generate an electrical pulse that causes the heartbeat. **Atrioventricular block**: A repeatedly occurring sudden loss of consciousness caused by an impaired electrical conduction in the sinoatrial node. **Subendocardial** : Located under the endocardium which is a membrane that lines the interior of the heart. **Myocardial Infarction** : A heart attack. **Dysrhythmia**: An irregular heartbeat. **Atrial Fibrillation**: A rapid fluttering or twitching of the heart muscles.

Acute Myocardial Infarction, Discharged Alive

Diagnoses: that frequently accompanied acute myocardial infarction, discharged alive were: 1) Subendocardial infarction (4107), 2) Congestive heart failure (4280), 3) Coronary atherosclerosis of native coronary artery (41401), 4) Hypertension (4019), 5) Hyperlipidemia (2722,4), 6) Tobacco use disorder (3051).

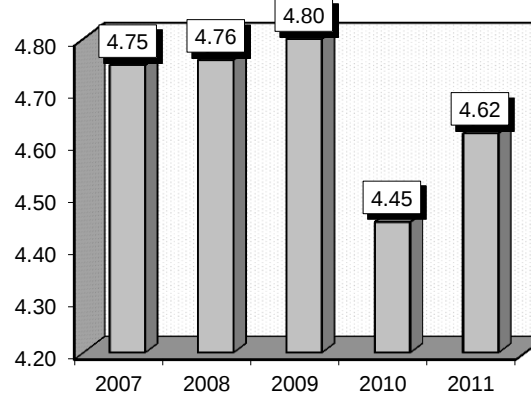

Definitions: **Subendocardial:** The layer of tissue just beneath the endocardium. **Endocardium:** A lining within the inner heart including the valves and bloodvessels. **Acute myocardial infarction:** (AKA heart attack) The early critical stage of necrosis of heart muscle tissue caused by a blockage of a coronary artery. **Necrosis:** Localized tissue death that occurs in groups of cells in response to disease or injury. **Coronary artery(s):** The heart has two main coronary arteries, the right and the left. The right coronary artery curves around the right side of the heart to supply blood to the front and back of that side. The left coronary artery supplies blood to the left side of the heart and has two distinct branches. Atherosclerosis is the most common reason for the blockage of blood vessels. Atherosclerosis occurs when fat and cholesterol build up on the inside walls of hardened arteries. This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle. **Atherosclerosis:** Clogging, hardening and narrow of the arteries and blood vessels. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol.

Acute Myocardial Infarction, Expired

Diagnoses: that frequently accompanied acute myocardial infarction, expired were: 1) Subendocardial infarction (4107), 2) Congestive heart failure (4280), 3) Coronary atherosclerosis of native coronary artery (41401), 4) Cardiac arrest (4275), 5) Hypertension (4019), 6) Arterial fibrillation (42731), 7) Diabetes mellitus (250).

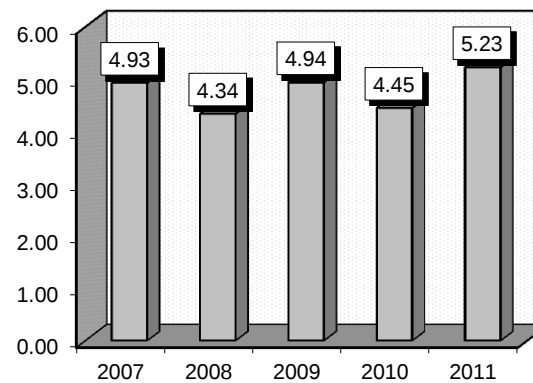

Definitions: **Subendocardial:** The layer of tissue just beneath the endocardium. **Endocardium:** A lining within the inner heart including the valves and bloodvessels. **Acute myocardial infarction:** (AKA heart attack) The early critical stage of necrosis of heart muscle tissue caused by a blockage of a coronary artery. **Necrosis:** Localized tissue death that occurs in groups of cells in response to disease or injury. **Coronary artery(s):** The heart has two main coronary arteries, the right and the left. The right coronary artery curves around the right side of the heart to supply blood to the front and back of that side. The left coronary artery supplies blood to the left side of the heart and has two distinct branches. Atherosclerosis is the most common reason for the blockage of blood vessels. Atherosclerosis occurs when fat and cholesterol build up on the inside walls of hardened arteries. This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle. **Atherosclerosis:** Clogging, hardening and narrow of the arteries and blood vessels. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Fibrillation:** Abnormal uncontrolled rapid contraction of the fibers in the heart.

Heart Failure & Shock

Diagnoses: that frequently accompanied heart failure and shock were: 1) Hypertension (4019), 2) Atrial fibrillation (42731), 3) Diabetes mellitus (25000), 4) Coronary atherosclerosis of native coronary artery (41401), 5) Hyperlipidemia (2724).

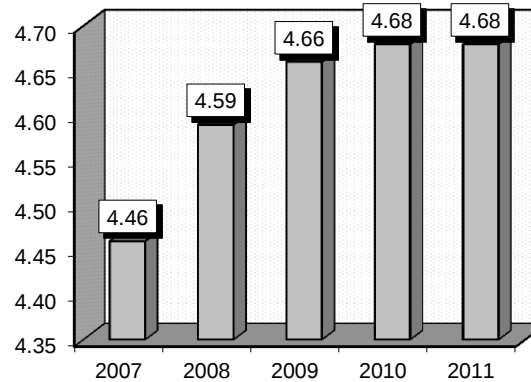

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Atrial fibrillation:** An irregular heart rhythm causing an incomplete emptying of blood from the atria. **Atria:** The two upper chambers of the heart. **Heart failure:** A condition in which the heart cannot pump enough blood to meet the requirements of the body tissues. Heart failure is closely associated with many forms of heart disease, most of which affect the left side of the heart. Clinicians divide heart failure into left-sided heart failure and right-sided heart failure. **Congestive heart failure:** impaired cardiac pumping, failure of the ventricles to eject blood efficiently results in volume overload. **Shock:** An abnormal condition of inadequate blood flow to the body's tissues, with life-threatening cellular dysfunction. **Hypertensive heart disease:** A late complication of hypertension (high blood pressure) that affects the heart. Hypertension increases the workload of the heart and over time, this can cause thickening of the heart muscle and the symptoms of hypertensive heart disease. As the heart continues to pump against elevated pressure in the blood vessels, the left ventricle becomes enlarged and the amount of blood pumped by the heart each minute goes down, and without treatment, symptoms of congestive heart failure may develop. **Atherosclerosis:** Clogging, hardening and narrow of the arteries and blood vessels. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol.

Cardiac Arrest, Unexplained

Diagnoses: that frequently accompanied cardiac arrest, unexplained were: 1) Hypertension (4019), 2) Congestive heart failure (4280), 3) Acute respiratory failure (51881), 4) Axonic brain damage (3481), 5) Diabetes mellitus (25000), 6) Acidosis (2762), 7) Hypotension (458).

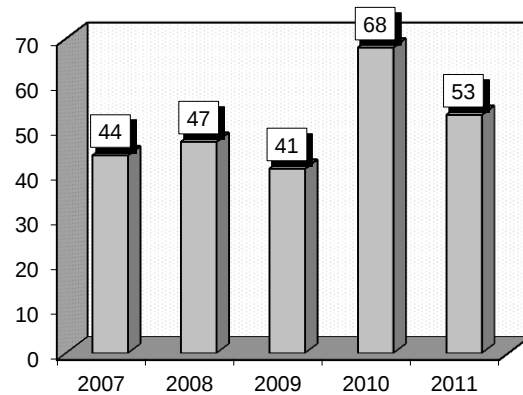

Definitions: Hypertension: Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

Acidosis: Excessive acidity of body fluids due to accumulation of acids as may happen in diabetes or kidney disease. **Axonic:** Pertaining to the arm of a nerve cell that normally transmits outgoing signals from one cell body to another. **Diabetes Mellitus:** High blood sugar resulting from low levels of insulin or insulin resistance.

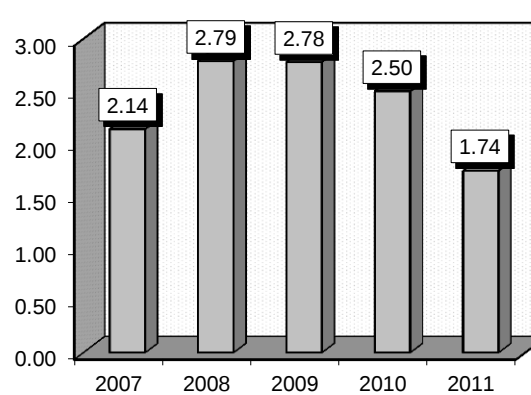

Hypopotassemia: Disorder of fluid, electrolyte, and acid-base balance. **Heart failure:** A condition in which the heart cannot pump enough blood to meet the requirements of the body tissues. Heart failure is closely associated with many forms of heart disease, most of which affect the left side of the heart. Clinicians divide heart failure into left-sided heart failure and right-sided heart failure. **Congestive heart failure:** Impaired cardiac pumping, failure of the ventricles to eject blood efficiently results in volume overload. **Shock:** An abnormal condition of inadequate blood flow to the body's tissues, with life-threatening cellular dysfunction. **Atherosclerosis:** Clogging, hardening and narrow of the arteries and blood vessels. **Hypotension:** Blood pressure below normal.

Peripheral Vascular Disorders

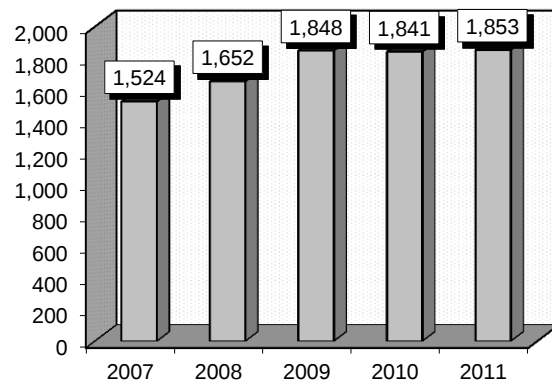

Diagnoses: that frequently accompanied peripheral vascular disorders were: 1) Hypertension (4019), 2) Venous embolism and thrombosis of deep vessels of proximal lower extremity such as femoral, thigh, or upper leg (45341), 3) Tobacco use disorder (3051), 4) Chronic airway obstruction (496), 5) Other and unspecified hyperlipidemia (2724), 6) Atrial fibrillation (42731).

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Embolism:** A sudden blocking of an artery by a clot (embolus) or foreign object such as a blood clot, gas bubble, cholesterol, fat or tissue. The blockage can cause damage down stream from lack of oxygen or nutrients to a body tissue. **Thrombosis:** The presence or formation of a blood clot within a blood vessel. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol. **Fibrillation:** Abnormal uncontrolled rapid contraction of the fibers in the heart

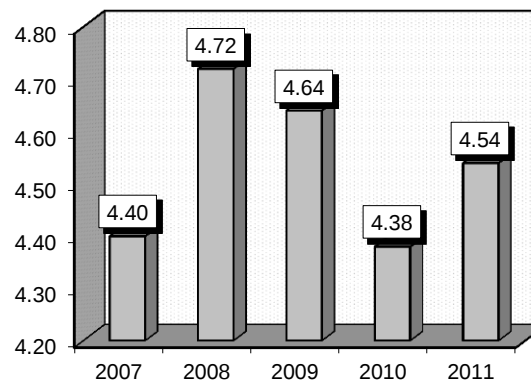

Comments: This page largely pertains to vascular disorders peripheral to the heart.

Atherosclerosis

Diagnoses: that frequently accompanied atherosclerosis were: 1) Hypertension (4019), 2) Intermediate coronary syndrome (4111), 3) Old myocardial infarction (412), 4) Tobacco use disorder (3051), 5) Congestive heart failure (4280), 6) Other and unspecified hyperlipidemia (2724), 7) Esophageal reflux (53081).

Definitions: Hypertension: Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

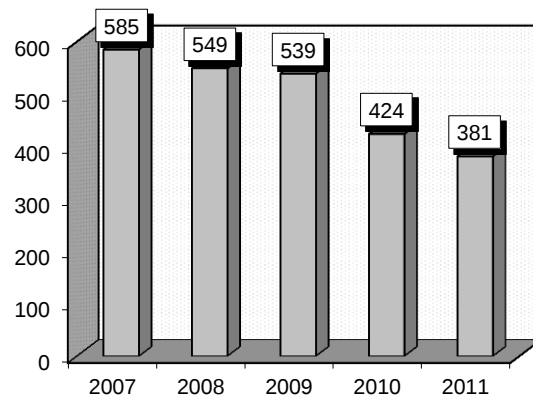

Myocardial infarction: (Heart Attack) A heart attack occurs when the blood supply to part of the heart is cut off. **Necrosis:** Tissue death of a region of the myocardium caused by an interruption in the supply of blood to the heart, usually as a result of occlusion of a coronary artery. **Myocardium:** The middle and thickest of the three layers making up the wall of the heart. **Embolism:** A sudden blocking of an artery by a clot (embolus) or foreign object such as a blood clot, gas bubble, cholesterol, fat or tissue.

The blockage can cause damage down stream from lack of oxygen or nutrients to a body tissue. **Thrombosis:** The presence or formation of a blood clot within a blood vessel. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol. **Fibrillation:** Abnormal uncontrolled rapid contraction of the fibers in the heart.

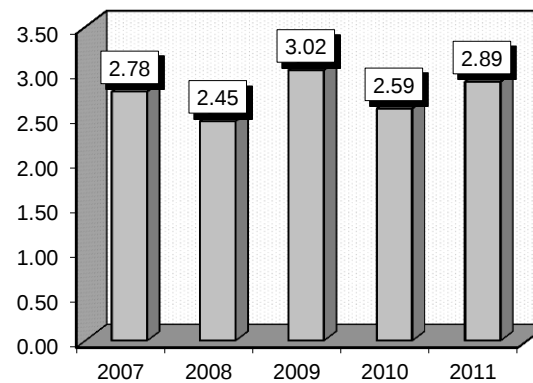

Atherosclerosis: Clogging, hardening and narrowing of the arteries and blood vessels.

Hypertension

Diagnoses: that frequently accompanied hypertension were: 1) Diabetes Mellitus II without mention of complication (25000), 2) Tobacco use disorder (3051), 3) Other and unspecified hyperlipidemia (2724), 4) Chest pain (78659), 5) Hypopotassemia, Hypokalemia (2768).

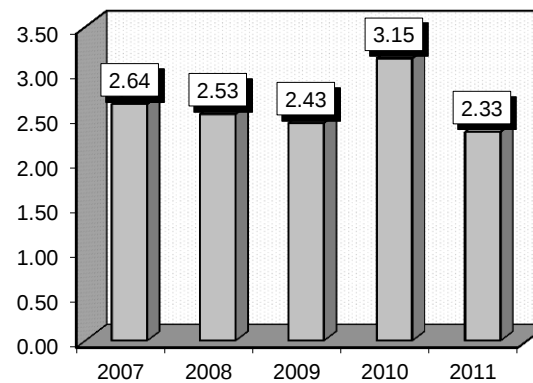

Definitions: **Diabetes mellitus:** A group of disorders in which the body is unable to competently process blood sugars leading to hyperglycemia. This can lead to a host of ailments including poor circulation, kidney disorders and blindness. **Hyperglycemia:** A condition in which an excessive amount of glucose circulates in the blood plasma. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol. **Chest pain:** A physical complaint that requires immediate diagnosis and evaluation. Chest pain can be a sign of cardiac disease, or of pulmonary (lung) disease. Over 90% of severe chest pain is caused by coronary artery disease, spinal root compression or a psychological disturbance. **Hypopotassemia:** Hypokalemia. Abnormally low levels of potassium circulation in the blood. Associated with adrenal tumors or taking diuretics.

Cardiac Congenital & Valvular Disorders

Diagnoses: that frequently accompanied cardiac congenital and valvular disorders were: 1) Aortic valve disorders (4241), 2) Congestive heart failure (4280), 3) Hypertension (4019), 4) Other and unspecified hyperlipidemia (2724), 5) Hypopotassemia (2768), 6) Respiratory abnormality (78609), 7) Ventricular septal defect (7454).

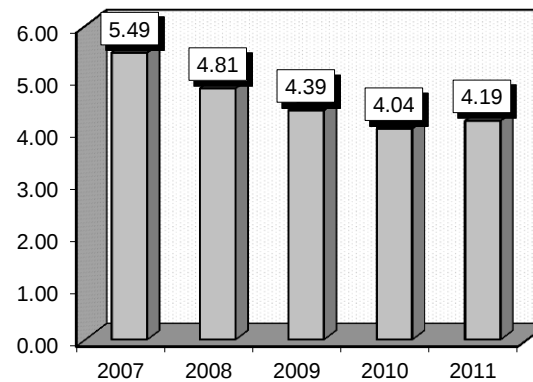

Definitions: **Aorta:** The largest artery in the body. It carries oxygen-rich blood away from the heart to vessels that reach the rest of the body. **Septal defect:** defect of the septum. **Septum:** The muscular wall separating the right and left sides of the heart. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol. **Chest pain:** A physical complaint that requires immediate diagnosis and evaluation. Chest pain can be a sign of cardiac disease, or of pulmonary (lung) disease. Over 90% of severe chest pain is caused by coronary artery disease, spinal root compression or a psychological disturbance. **Hypopotassemia:** Hypokalemia. Abnormally low levels of potassium circulation in the blood. Associated with adrenal tumors or taking diuretics.

Cardiac Arrhythmia & Conduction Disorders

Diagnoses: that frequently accompanied cardiac arrhythmia and conduction disorders were: 1) Atrial fibrillation (42731), 2) Hypertension (4019), 3) Congestive heart failure (4280), 4) Hyperlipidemia (2724), 5) Chronic airway obstruction (496), 6) Diabetes Mellitus II without mention of complication (25000).

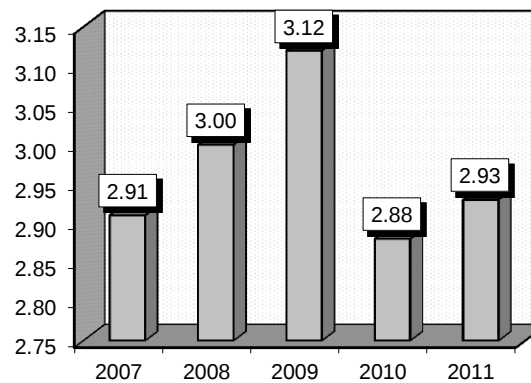

Definitions: **Atrial fibrillation:** A cardiac arrhythmia characterized by disorganized electrical activity in the atria accompanied by an irregular ventricular response that is usually rapid. The atria quiver instead of pumping in an organized fashion, increasing the risk of stroke. **Atrial flutter:** A type of atrial tachycardia (rapid beating of the atria) characterized by contraction rates between 230-380 beats per minute. **Sinotrial node dysfunction:** Any disturbance in the normal functioning of the sinoatrial node (a cluster of hundreds of cells located in the right atrial wall of the heart. It's comprised of heart muscle that generates impulses that travel swiftly throughout the both atria, causing them to contract). **Cardiac dysrhythmias:** Any abnormality in a cardiac rhythm pattern. **Paroxysmal ventricular tachycardia:** A rapid heartbeat of sudden onset and termination caused by a quick succession of discharges from an ectopic (an impulse that originates in the heart at a site other than the sinus node) site in the ventricle. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol.

Angina Pectoris

Diagnoses: that frequently accompanied angina pectoris were: 1) Intermediate coronary syndrome (4111), 2) Hypertension (4019), 3) Tobacco use disorder (3051), 4) Hyperlipidemia (2724), 5) Diabetes Mellitus II without mention of complication (25000), 6) Coronary atherosclerosis (41400).

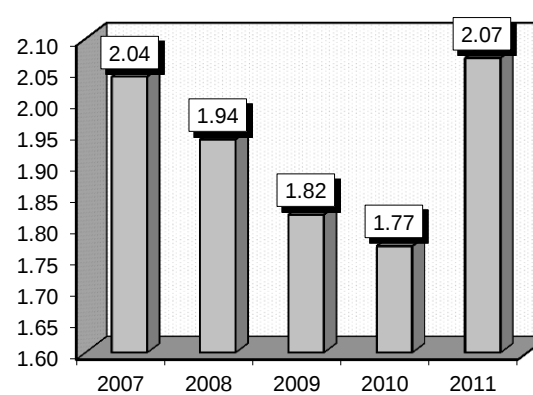

Definitions: **Chest pain:** A physical complaint that requires immediate diagnosis and evaluation. Chest pain can be a sign of cardiac disease, such as angina pectoris, myocardial infarction (AKA heart attack), pericarditis, or of pulmonary (lung) disease, such as pleurisy, pneumonia or pulmonary embolism or infarction. Use of illegal drugs such as cocaine may also cause chest pain. Less common, but also life-threatening conditions that cause chest pain include aortic dissection and pneumothorax. **Angina:** A spasmodic choking feeling at rest. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol. **Diabetes mellitus:** A group of disorders in which the body is unable to competently process blood sugars leading to hyperglycemia. This can lead to a host of ailments including poor circulation, kidney disorders and blindness. **Hyperglycemia:** A condition in which an excessive amount of glucose circulates in the blood plasma. **Ischemia:** Localized tissue anemia due to obstruction of arterial blood flow. **Atherosclerosis:** Clogging, hardening and narrow of the arteries and blood vessels.

Stomach, Esophageal & Duodenal Procedures

Diagnoses and Procedures: that frequently accompanied stomach, esophageal & duodenal procedures were: 1) Diaphragmatic hernia without mention of obstruction or gangrene (5533), 2) Congenital hypertrophic pyloric stenosis (7505), 3) Esophageal reflux (53081), 4) Laparoscopic procedures for creation of esophagogastric sphincteric competence (4467), 5) Pyloromyotomy (433), 6) Suture of duodenal ulcer site (4442), 7) Partial gastrectomy with anastomosis to jejunum (437) .

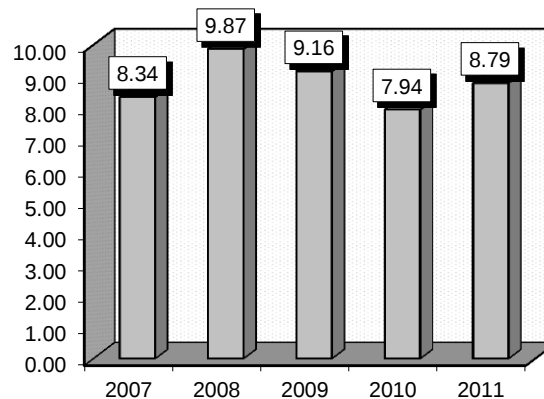

Definitions: **Esophagus:** The tube from the pharynx (below the throat) to the stomach. The gullet. **Duodenal:** The beginning part of the small intestines, starting directly below the stomach. **Jejunum:** The section of the small intestine between the duodenum and the ileum. **Ileum:** The section of the small intestine from the jejunum to the cecum. **Cecum:** A small sac like area at the end of the small intestines, and the beginning of the large intestine. **Pyloric Sphincter:** A ring of smooth muscles at the bottom of the stomach. **Pyloric Stenosis :** A narrowing of the pyloric sphincter that prevents food from entering the small intestines. **Pyloromyotomy:** An incision into the pyloric canal to relieve the symptoms of pyloric stenosis. **Anastomosis :** A surgical connection between two normally separated organs.

Major Small & Large Bowel Procedures

Procedures: that frequently accompanied major small and large bowel procedures were: 1) Sigmoidectomy (4576), 2) Hemicolectomy (4573,5), 3) Partial excision of large intestine (4579), 4) Partial resection of small intestine (4562), 5) Other Lysis of peritoneal adhesions (5459), 6) Parenteral infusion of concentrated nutritional substances (9915), 7) Transfusion of packed cells (9904), 8) Colostomy (461), 9) Large-to-Large intestinal anastomosis (4594).

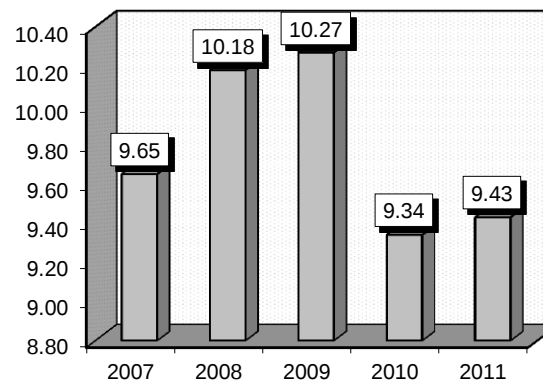

Definitions: **Sigmoidectomy:** Surgical removal of part or all of the sigmoid colon (usually to remove a malignant tumor). **Sigmoid colon:** Portion of the large intestine between the descending colon and the rectum. **Hemicolectomy:** Surgical removal of about half of the right side of the colon with subsequent joining of the remaining colon. **Excision:** Surgical removal of a part of the body, including cancerous growth. **Resection:** A surgical removal of tissue. **Colostomy:** The surgical creation of an opening between the colon and the surface of the body. Part of the colon is brought out onto the abdomen to create a stoma. A bag is placed over this to collect waste material. **Stoma:** A surgically created opening in an organ. **Lysis:** The breakdown of a cell caused by damage to its plasma (outer) membrane. Lysis can be caused by chemical or physical action. **Peritoneum:** The tissue that lines the abdominal wall and pelvic cavity. **Anastomosis:** An operation to connect two body parts. An example is an operation in which a part of the colon is removed and the two remaining ends are rejoined.

Rectal Resection

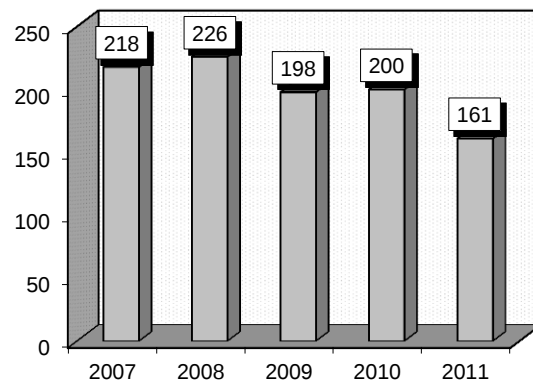

Procedures: that frequently accompanied rectal resection were: 1) Proctosigmoidoscopy (4821-3), 2) Transfusion of packed cells (9904), 3) Anterior resection of rectum with synchronous colostomy (4862), 4) Incidental appendectomy (4719), 5) Other Lysis of peritoneal adhesions (5459), 6) Closure of stoma of large intestine (4652).

Definitions: **Resection:** A surgical removal of tissue. **Proctosigmoidoscopy:** An examination of the rectum and the lower part of the colon using a thin, lighted instrument called a sigmoidoscope. **Transfusion:** A replacement of bodily fluids or cells. **Anterior:** Anatomical term referring to the front of the body. **Colostomy:** The surgical creation of an opening between the colon and the surface of the body. Part of the colon is brought out onto the abdomen to create a stoma. A bag is placed over this to collect waste material. **Stoma:** A surgically created opening in an organ. **Lysis:** The breakdown of a cell caused by damage to its plasma (outer) membrane. Lysis can be caused by chemical or physical action. **Peritoneum:** The tissue that lines the abdominal wall and pelvic cavity.

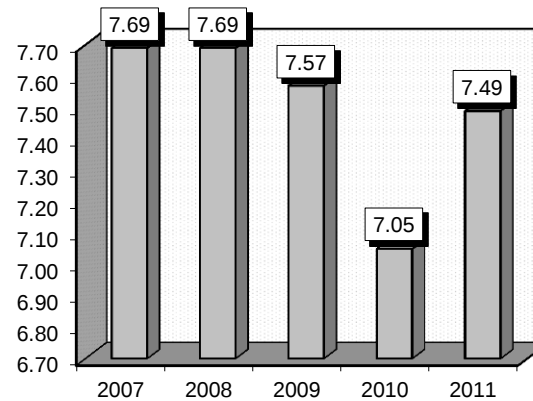

Comments: Rectal resections are performed to repair damage caused to the rectum by diseases of the lower intestinal tract.

Minor Small & Large Bowel Procedures

Procedures: Procedures that frequently accompanied minor small and large bowel procedures were: 1) Closure of stoma of large intestine (4652), 2) Transfusion of packed cells (9904), 3) Venous catheterization (3893), 4) Flexible sigmoidoscopy (4524), 5) Incision of large intestine (4503), 6) Colonoscopy (4523).

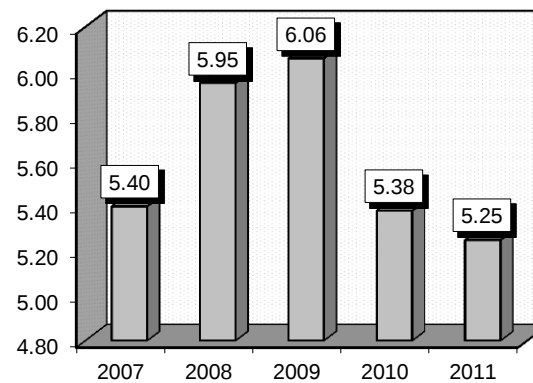

Definitions: **Stoma:** A surgically created opening in an organ. **Transfusion:** A replacement of bodily fluids or cells. **Catheterization:** Passage of a tubular, flexible surgical instrument into a body channel or cavity to withdraw or introduce fluid. **Sigmoidoscopy:** A diagnostic procedure that uses a flexible viewing tube to allow the doctor to see the inner walls of the colon. During this procedure, a tube is gently passed into the colon through the anus. **Peritoneum:** The tissue that lines the abdominal wall and pelvic cavity. **Colonoscopy:** An examination of the colon using a lighted, flexible tube (colonoscope) inserted into the rectum. A colonoscopy allows a doctor to see the inside of the colon.

Inguinal & Femoral Hernia Procedures

Diagnoses and Procedures: that frequently accompanied inguinal & femoral hernia procedures were: 1) Inguinal hernia, with obstruction, without mention of gangrene, unilateral or unspecified (not specified as recurrent) (55010), 2) Inguinal hernia, without mention of obstruction or gangrene, unilateral or unspecified (not specified as recurrent) (55090), 3) Inguinal hernia with obstruction, without mention of gangrene, unilateral or unspecified, recurrent (55011), 4) Repair of inguinal hernia with graft or prosthesis, not otherwise specified (5305), 5) Other and open repair of direct inguinal hernia with graft or prosthesis (5303), 6) Unilateral repair of inguinal hernia, not otherwise specified (5300).

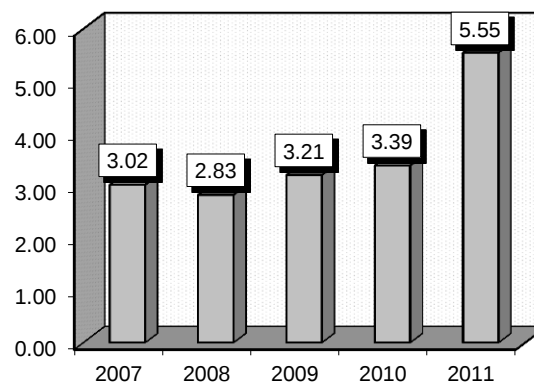

Definitions: **Inguinal:** Located in the groin. **Femoral:** Located in the thigh or femur. **Hernia:** A rupture of a bodily membrane through which there is a protrusion of an organ or other body part. **Gangrene:** The death of bodily tissue often caused by an insufficient supply of blood.

Hernia Procedures Except Inguinal & Femoral

Diagnoses and Procedures: that frequently accompanied hernia procedures except inguinal & femoral were: 1) Incisional hernia without mention of obstruction or gangrene (55321), 2) Incisional ventral hernia with obstruction (55221), 3) Umbilical hernia with obstruction (5521), 4) Other open incisional hernia repair with graft or prosthesis (5361), 5) Other and open repair of other hernia of anterior abdominal wall with graft or prosthesis (5369), 6) Laparoscopic incisional hernia repair with graft or prosthesis (5362).

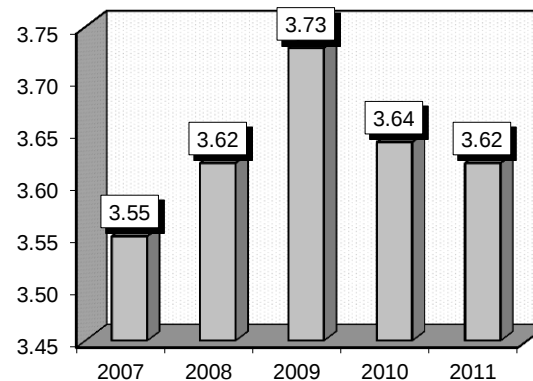

Definitions: **Inguinal:** Located in the groin. **Femoral:** Located in the thigh or femur. **Hernia:** A rupture of a bodily membrane through which there is a protrusion of an organ or other body part. **Gangrene:** The death of bodily tissue often caused by an insufficient supply of blood. **Laparoscopy:** Surgery via the insertion of tools and a camera through small incisions at the area of interest. Laparoscopic surgery is much less invasive than open surgery.

Gastrointestinal Hemorrhage

Diagnoses: that frequently accompanied gastrointestinal hemorrhage were: 1) Hypertension (4019), 2) Chronic anemia due to blood loss (2800), 3) Acute post hemorrhagic anemia (2851), 4) Inflammatory and toxic neuropathy (5789), 5) Diabetes Mellitus II without mention of complication (25000), 6) Diaphragmatic hernia without mention of obstruction or gangrene (5533), 7) Unspecified hyperlipidemia (2724).

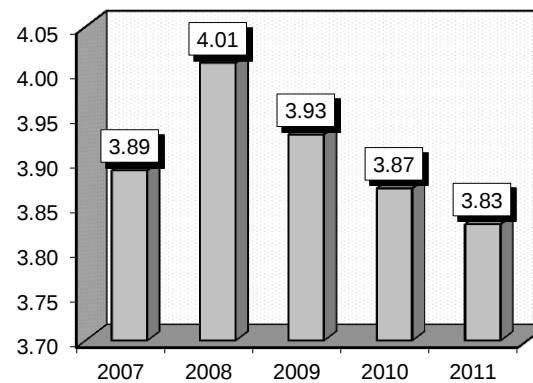

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hemorrhage:** The loss of a large amount of blood in a short period of time. Gastrointestinal (GI) hemorrhage can occur in the esophagus, stomach, duodenum, and small and large intestine. Causes of hemorrhage of the GI tract include but are not limited to, esophageal varices, stomach ulcers, duodenal ulcers, peptic ulcers, acute gastritis, diverticulitis, and diverticulosis. **Diverticulosis:** The presence of pouchlike herniations through the muscular layer of the colon. **Diverticulitis:** Inflammation of one or more of these pouchlike herniations. **Duodenum:** The first part of the small intestine. It is located below the stomach. **Hyperlipidemia:** Elevated levels of lipids in the blood stream including cholesterol. **Diabetes mellitus:** A group of disorders in which the body is unable to competently process blood sugars leading to hyperglycemia. This can lead to a host of ailments including poor circulation, kidney disorders and blindness. **Hyperglycemia:** A condition in which an excessive amount of glucose circulates in the blood plasma. **Anemia:** A decrease in hemoglobin (a compound in the blood that carries oxygen to the cells from the lungs and carbon dioxide away from the cells to the lungs) in the blood to levels below normal.

Peptic Ulcer

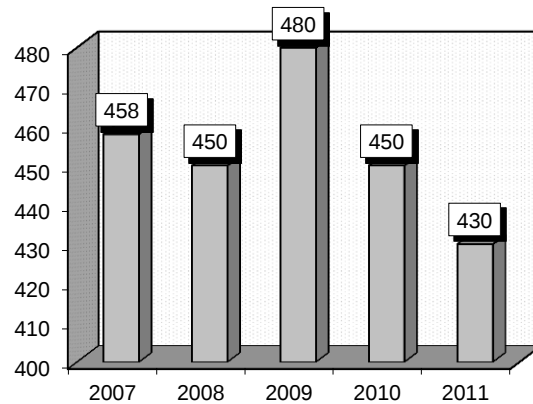

Diagnoses and Procedures: that frequently accompanied peptic ulcer were: 1) Gastric ulcer, unspecified as acute or chronic, without mention of hemorrhage or perforation, without mention of obstruction (53190), 2) Ulcer of esophagus with bleeding (53021), 3) Duodenal ulcer, unspecified as acute or chronic, without hemorrhage or perforation, without mention of obstruction (53290), 4) Acquired hypertrophic pyloric stenosis (5370), 5) Esophagogastroduodenoscopy [EGD] with closed biopsy (4516), 6) Other endoscopy of small intestine (4513).

Definitions: **Peptic Ulcer:** A sore in the lining of the stomach or duodenum. **Duodenum:** The first part of the small intestine located at the bottom of the stomach. **Duodenal Ulcer:** Another name for peptic ulcer. **Hypertrophic Pyloric Stenosis :** An extreme narrowing of the opening at the bottom of the stomach into the small intestines.

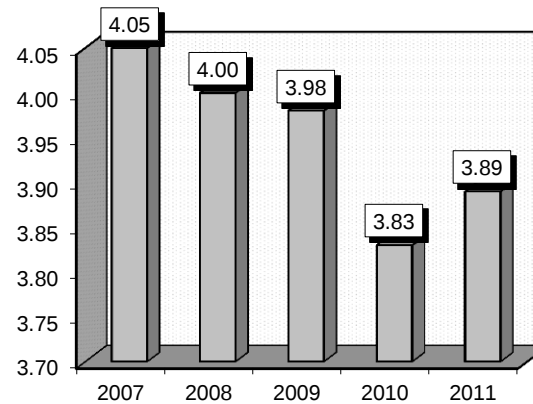

Esophagogastroduodenoscopy: The use of a flexible endoscope (camera) to view from the inside of the throat all the way down to the beginning of the small intestines. The purpose is to examine the health of the surface lining, and search for ulcers or inflammation.

Inflammatory Bowel Disease

Diagnoses and Procedures: that frequently accompanied inflammatory bowel disease were: 1) Regional enteritis of unspecified site (5559), 2) Ulcerative colitis, unspecified (5569), 3) Universal ulcerative (chronic) colitis (5566), 4) Regional enteritis of small intestine (5550), 5) Regional enteritis of large intestine (5551), 6) Closed [endoscopic] biopsy of large intestine (4525), 7) Esophagogastroduodenoscopy [EGD] with closed biopsy (4516).

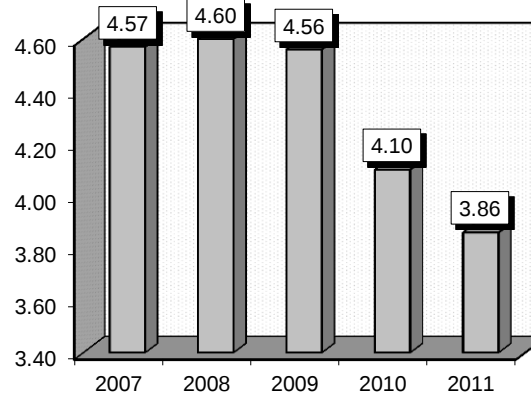

Definitions: Inflammatory Bowel Disease: Any one of a group of disorders in which the upper or lower intestines become irritated and inflamed. **Colitis:** Inflammation and/or ulcers in the intestines or rectum. **Endoscopic Biopsy:** A flexible camera (endoscope) is inserted into the body to view a potentially diseased area. A sample (biopsy) is taken for laboratory analysis. **Esophagogastroduodenoscopy:** The use of a flexible endoscope (camera) to view from the inside of the throat all the way down to the beginning of the small intestines. The purpose is to examine the health of the surface lining, and search for ulcers or inflammation.

Gastrointestinal Obstruction

Diagnoses: that frequently accompanied gastrointestinal obstruction were: 1) Hypertension (4019), 2) Dehydration (27651), 3) Paralysis of intestine or colon without mention of hernia (5601), 4) Hypopotassemia (2768), 5) Diabetes Mellitus (25000), 6) Tobacco use disorder (3051), 7) Intestinal or peritoneal adhesions with obstruction (postoperative) (postinfection).

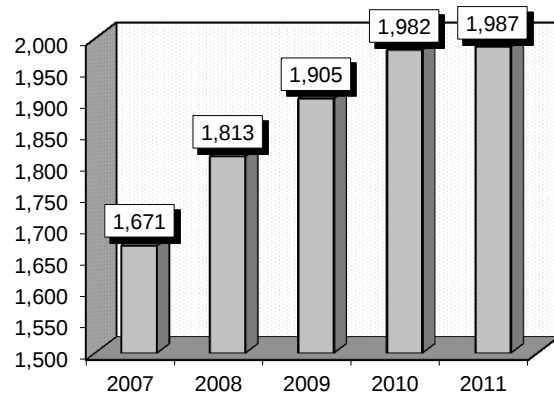

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

Dehydration: This can be caused by a lack of fluid intake, excessive urination possibly due to diuretics, diarrhea or vomiting. **Hernia:** Abnormal bulging or extrusion of an organ through tissue or muscle which contains it. **Hypopotassemia:** A deficiency of potassium in the blood. **Gastroenteritis:** Inflammation of the stomach and intestines accompanying numerous gastrointestinal disorders. It can be caused by parasites, unclean water, food poisoning or allergens and stress. **Diverticulitis:** inflammation of one or more pouchlike herniations through the muscular layer of the colon. **Diabetes Mellitus:** High blood sugar resulting from low levels of insulin or insulin resistance.

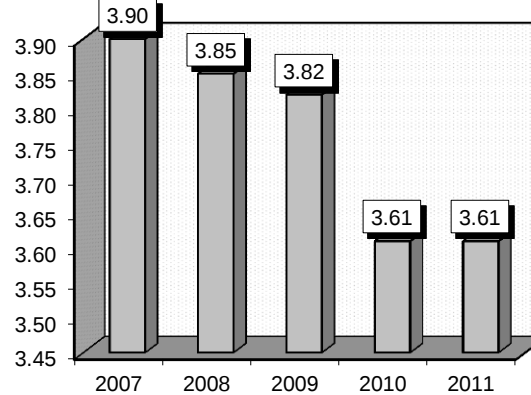

Peritoneal: Having to do with the parietal peritoneum (the tissue that lines the abdominal wall and pelvic cavity) and visceral peritoneum (the tissue that covers most of the organs in the abdomen, including the intestines).

Cholecystectomy - Nonlaparoscopic

Diagnoses and Procedures: that frequently accompanied cholecystectomy nonlaparoscopic were: 1) Calculus of gallbladder with acute cholecystitis, without mention of obstruction (57400), 2) Acute cholecystitis (5750), 3) Acute pancreatitis (5770), 4) Chronic cholecystitis (57511), 5) Cholecystectomy (5122).

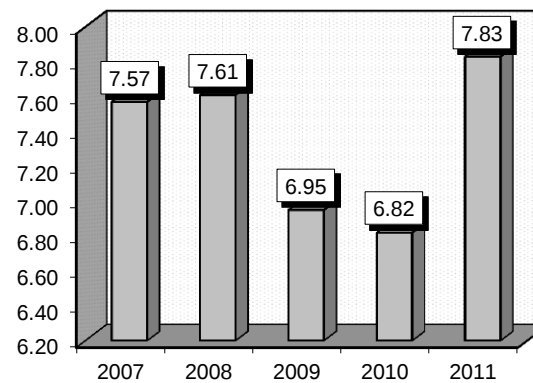

Definitions: Cholecystectomy Nonlaparoscopic : Removal of the gallbladder through open surgery, in contrast to using a laparoscope (flexible surgical tools that are inserted into the body through small openings). **Cholecystitis :** Inflammation of the gallbladder. **Pancreatitis :** Inflammation of the pancreas.

Cholecystectomy - Laparoscopic

Procedures: that frequently accompanied laparoscopic cholecystectomy were: 1) Intraoperative cholangiogram (8753), 2) Endoscopic sphincterotomy (5185), 3) Endoscopic removal of bile stones (5188), 4) Laparoscopic peritoneal adhesiolysis (5451), 5) Esophagogastroduodenoscopy with closed biopsy (4516).

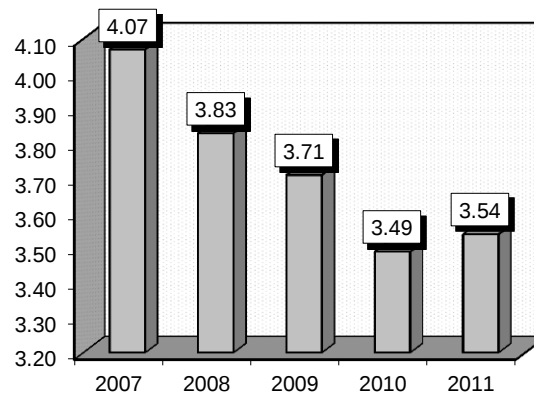

Definitions: **Laparoscope:** A narrow tube with a light and a fiberoptic camera. It is inserted through a small incision to assist in surgeries by transmitting images to the physician. **Cholecystectomy:** The surgical removal of the gallbladder. **Intraoperative:** During the course of an operation. **Cholangiogram:** An X-ray study of the bile ducts performed with contrast injected into the ducts. **Sphincterotomy:** Surgical cutting/incision of a sphincter; incision of the internal sphincter of the anus, used in the treatment of anal fissure. **Peritoneal:** A membrane that lines the wall of the abdominal cavity. **Adhesiolysis:** The treatment for the removal of scarlike tissue that forms between two surfaces within the body. **Esophagogastroduodenoscopy:** Exam of the upper digestive tract using an endoscope. **Endoscope:** A small, flexible tube with a light and a lens on the end used to look into the esophagus, stomach, duodenum, colon, or rectum.

Cirrhosis & Alcoholic Hepatitis

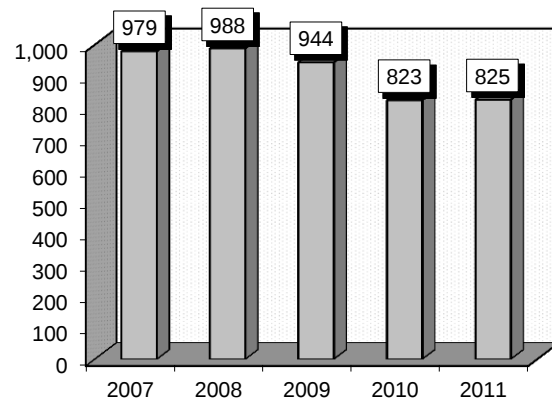

Diagnoses: that frequently accompanied cirrhosis and alcoholic hepatitis were: 1) Ascites (7895), 2) Portal hypertension (5723), 3) Tobacco use disorder (3051), 4) Esophageal varices in diseases classified elsewhere (45620), 5) Hypertension (4019).

Definitions: **Cirrhosis:** A chronic liver disease that causes scarring of the liver and liver dysfunction. This often has many complications, including accumulation of fluid in the abdomen (ascites), bleeding disorders (coagulopathy) increased pressure in the blood vessels (portal hypertension) and confusion or a change in the level of consciousness (hepatic encephalopathy). Common causes include hepatitis C and alcohol use. **Hepatitis:** Inflammation of the liver, characterized by anorexia, abdominal and gastric discomfort and abnormal liver function. **Portal hypertension:** An increased venous pressure in the portal circulation caused by compression or occlusion in the portal or hepatic vascular system. **Hepatitis C:** A type of hepatitis most commonly transmitted by blood transfusion or, used needle puncture. **Ascites:** Fluid in peritoneal (abdominal) cavity. **Varices:** Stretched veins such as those that form in the esophagus from cirrhosis. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

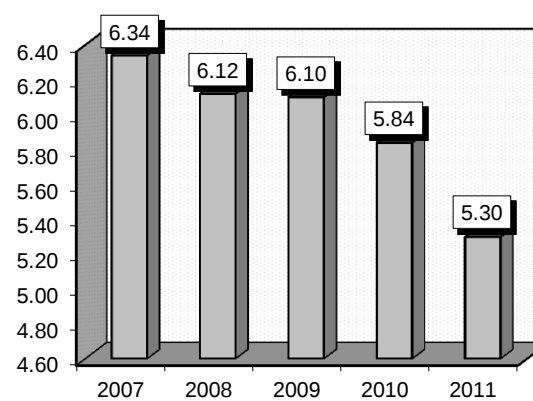

Comments: The liver is the largest internal organ in the human body. The liver helps the body digest fats, stores reserves of nutrients, filters poisons and wastes from the blood, synthesizes proteins, and regulates the levels of many chemicals found in the bloodstream.

Hip & Femur Procedures Except Major Joint

Procedures: that frequently accompanied hip and femur procedures except major joint were: 1) Open reduction reduction of fracture with internal fixation of femur (7935), 2) Closed reduction of fracture with internal fixation of femur (7915), 3) Transfusion of packed cells (9904), 4) Internal fixation of bone without fracture reduction (7855), 5) Removal of implanted devices from bone, femur (7865), 6) Bone graft, femur (7805), 7) Arthrotomy, hip (8015).

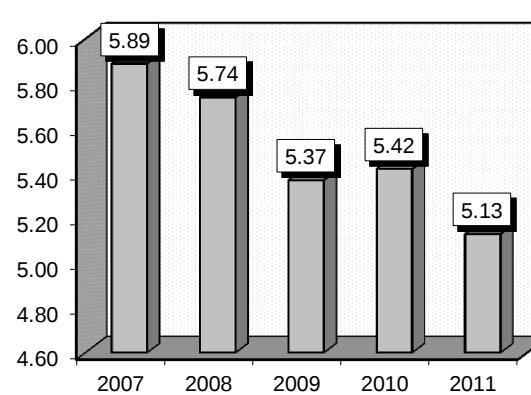

Definitions: **Open reduction:** A surgical procedure for reducing a fracture or dislocation. **Closed reduction:** The manual correction of a fracture without an incision. **Internal fixation:** A method of holding together the fragments of a fractured bone. After open reduction of the fracture, pins, wires, screws, plates or nails may be used to stabilize the fragments. **Bone graft:** The transplantation of a piece of bone from one part of the body to another to repair a skeletal defect. **Osteoclasis:** The intentional surgical fracture of a bone to correct a deformity. **Femur:** The thigh bone that extends from the pelvis to the knee. It is the longest and strongest bone in the body. **Closed reduction:** The manual corrections of fractures without incisions. **Transfusion:** A transfer of body fluids or tissues from one person to another. **Arthrotomy:** The surgical incision into a joint.

Knee Procedures

Diagnoses and Procedures: that frequently accompanied knee procedures were: 1) Pyogenic arthritis, pelvic region (71105), 2) Pyogenic arthritis, shoulder region (71101), 3) Other Arthrotomy, knee (8016), 4) Synovectomy, knee (8076).

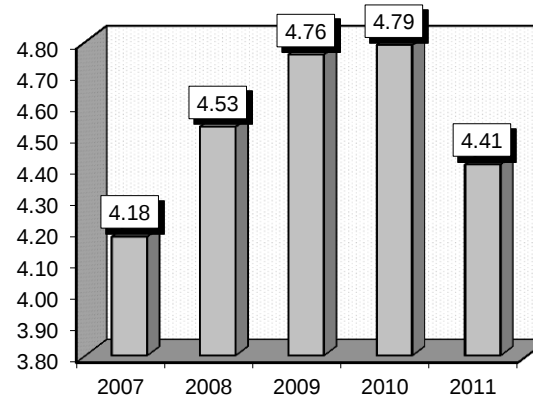

Definitions: **Pyogenic:** An infectious disease that causes pus to form around the knee. **Lower leg:** That portion of the leg between the knee and ankle. **Pelvic region:** The portion of the body that extends from the abdomen to the lower limbs (legs) that connects the spine to the femur bones. **Shoulder region:** That portion of body connecting the arms to the trunk specifically where clavicle joins the scapula. **Arthrotomy, knee:** Cut made in the knee joint. **Synovectomy:** Surgical removal of part or all of the synovial membrane.

Back & Neck Procedures Except Spinal Fusion

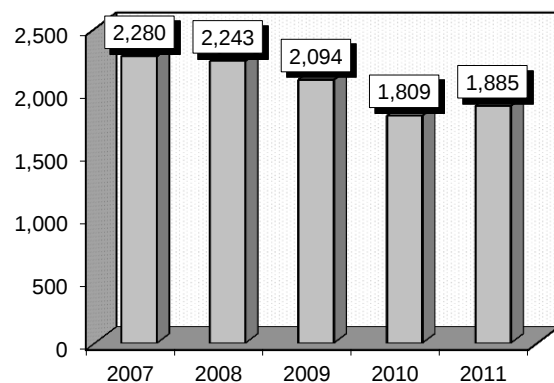

Procedures: that frequently accompanied back and neck procedures except spinal fusion were: 1) Excision of intervertebral disc (8051), 2) Shunt or vascular bypass (392), 3) Injection of steroid (9923), 4) Insertion of total disc prosthetic, lumbar (8465), 5) Excision of lesion from soft tissue (8339), 6) Implantation of intraspinal decompression device (8458).

Definitions: **Exploration:** Surgical intervention to find the cause of a disorder by opening a body cavity and examining the interior. **Decompression:** The removal of pressure.

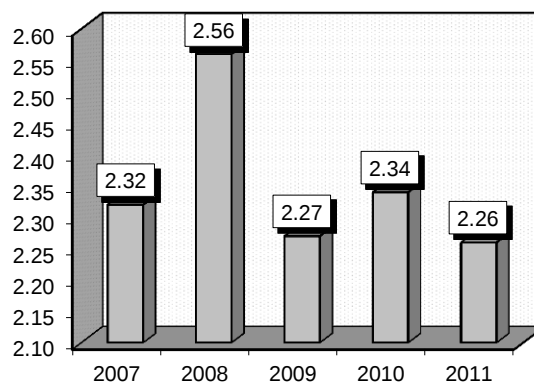

Comments: Additional related procedures included, but are not limited to, spinal cord exploration, excision of a spinal cord lesion, vertebral fracture repair, and insertion of a spinal stimulator. The spinal cord is an extension of the brain. It is protected by a bony structure called the vertebral or spinal column. There is a wide space that surrounds the spinal cord. This space contains the cerebrospinal fluid. All the information going from the brain to the limbs travels through the spinal cord. This then allows for movement. The spinal cord is the first relay station for sensory information (what we feel in our arms and legs) on its way to consciousness in various centers of the brain.

Medical Back Problems

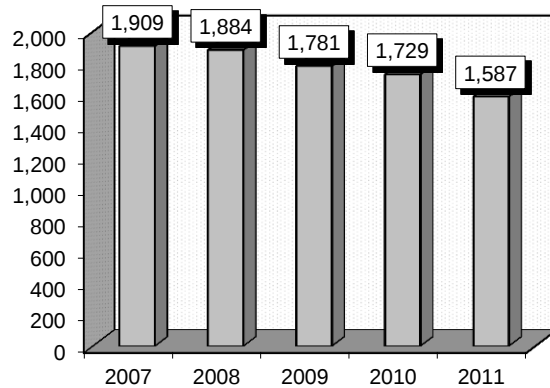

Diagnoses: that frequently accompanied medical back problems were: 1) Hypertension (4019), 2) Tobacco use disorder (3051), 3) Closed fracture of lumbar vertebral column without mention of spinal cord injury (8054), 4) Lumbago (7242), 5) Closed fracture of the dorsal, thoracic vertebral column without mention of spinal cord injury (8052).

Definitions: **Vertebra:** Any one of the bones of the spinal column. **Intervertebral:** The space between two vertebrae. **Myelopathy:** Disease of the spinal cord. **Stenosis:** An abnormal condition characterized by the constriction or narrowing of an opening or passageway in a body structure. **Lumbago:** Pain in the lumbar, lower, region of the spinal cord caused by muscle strain, rheumatoid arthritis, osteoarthritis, or a herniated intervertebral disk. **Fracture:** a traumatic injury to a bone in which the continuity of the bone tissue is broken. **Dorsal:** The back of something. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

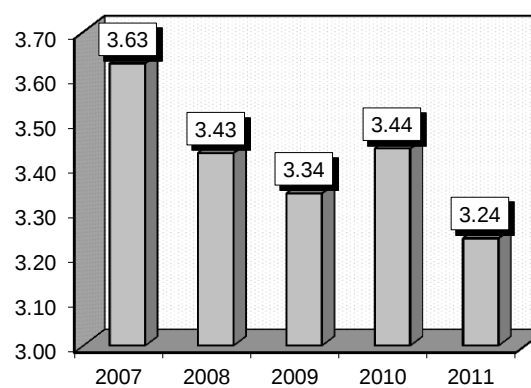

Comments: Diagnoses under this DRG, include but are not limited to, displacement of lumbar intervertebral disc without myelopathy, spinal stenosis, lumbago, closed fracture of dorsal vertebra and closed fracture of lumbar vertebra. It's interesting that persons with this diagnosis, as well as many other medical problems throughout this book, commonly have a diagnosis of tobacco use.

Mastectomy For Malignancy

Procedures: that frequently accompanied mastectomy for malignancy were: 1) Venous catheterization (3893), 2) Excision of axillary lymph node (4023), 3) Biopsy of lymphatic structure (4023), 4) Open biopsy of breast (8512), 5) Insertion of totally implantable vascular access device [VAD] (8607), 6) Regional lymph node excision (403), 7) Removal of breast implant (8594), 8) Mammoplasty (8589).

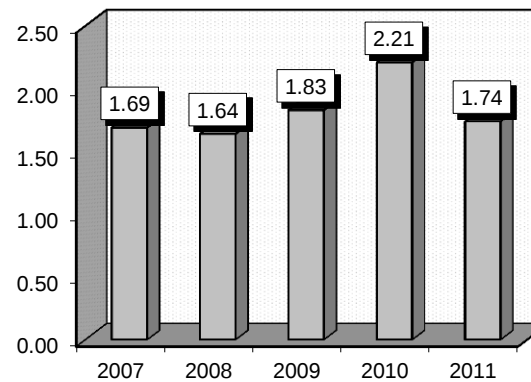

Definitions: **Mastectomy:** Mastectomy is undertaken in cases where the cancer is large or where tests have revealed abnormal changes in the breast tumour. In this instance, the entire breast is removed. Bilateral mastectomy is the removal of both breasts. **Malignancy:** A cancerous tumor that can invade and destroy nearby tissue and spread to other parts of the body. **Catheterization:** Passage of a tubular, flexible surgical instrument into a body channel or cavity to withdraw or introduce fluid. **Excision:** Surgical removal of a part of the body, including cancerous growth. **Axillary lymph node:** A lymph node in the armpit region that drains lymph channels from the breast. **Biopsy:** The removal of a sample of tissue for examination under a microscope to check for cancer cells. **Mammoplasty:** Any reconstructive or cosmetic surgical procedure that alters the size or shape of the breast.

Operating Room Procedures For Obesity

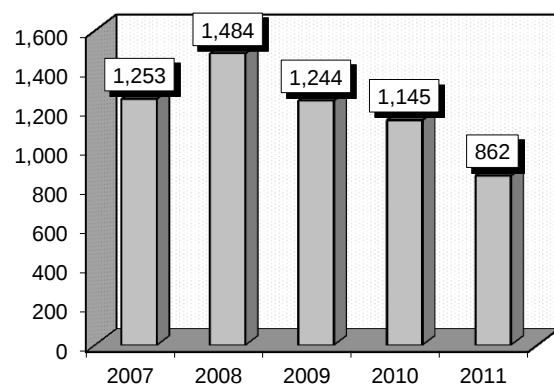

Procedures: that frequently accompanied operating room procedures for obesity were: 1) Laparoscopic gastroenterostomy (4438), 2) Laparoscopic gastric restriction procedure (4495) , 3) Laparoscopic peritoneal adhesiolysis (5451), 4) Abdominal repair of diaphragmatic hernia (537), 5) Laparoscopic gastroplasty (4468).

Definitions: Laproscopy: The insertion of a thin lighted tube with a camera (laparoscope) used to assist in operations without the need for making large incisions.

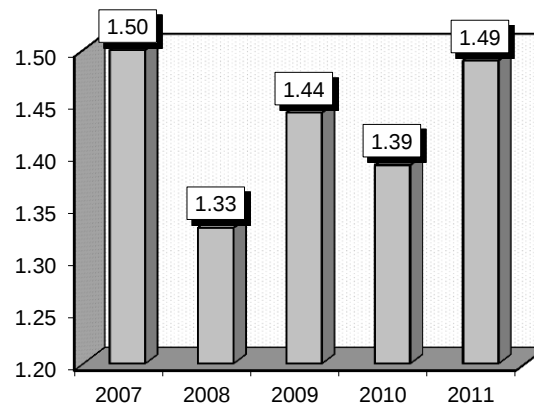

Gastroenterostomy: The surgical creation of a connection between the stomach and the jejunum. **Jejunum:** The longest part of the small intestine extending from the duodenum to the ileum. **Duodenum:** The first part of the small intestine. It is located below the stomach. **Ileum:** The lowest section of the small intestine. It is involved in absorbing digested food into the body. **Peritoneal:** A membrane that lines the wall of the abdominal cavity. **Adhesiolysis:** The treatment for the removal of scarlike tissue that forms between two surfaces within the body. **Diaphragmatic hernia:** A hole in the diaphragm through which the bowels can pass through. **Gastroplasty:** Any surgical treatment of the stomach or lower esophagus used to decrease the size of the stomach. This procedure is often done by dividing the stomach into a large and small pouch through the use of staples.

Diabetes

Diagnoses: that frequently accompanied diabetes were: 1) Hypertension (4019), 2) Diabetes with other specified manifestations such as diabetic hypoglycemia and hypoglycemic shock (25080), 3) Long term use of insulin (V5867), 4) Tobacco use disorder (3051), 5) Dehydration (27651), 6) Diabetes Mellitus with ketoacidosis (25011), 7) History of past noncompliance (V1581).

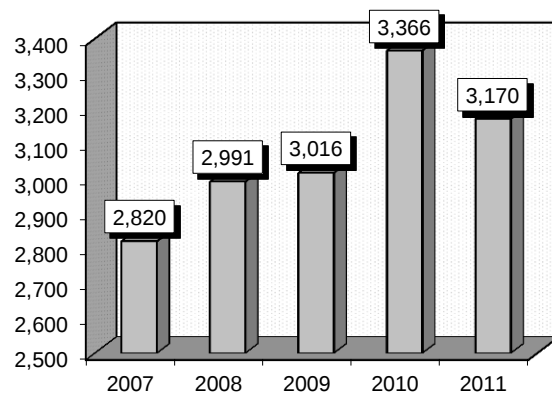

Definition: Hypertension: Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

Ketoacidosis: High blood glucose; often caused by illness or taking too little insulin. A life-threatening condition in which ketones, which result from the breakdown of fat for energy, accumulate in the bloodstream and the pH of the blood decreases.

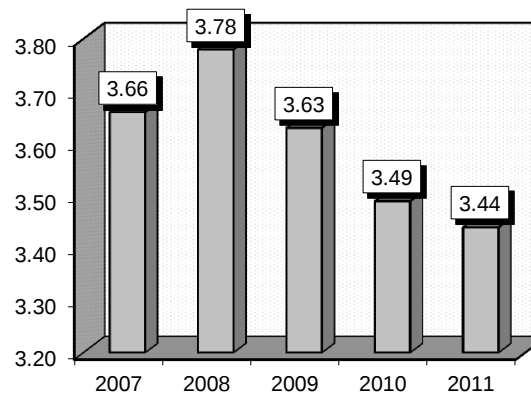

Comments: Diabetes is a disease in which blood sugar (glucose) levels are abnormally high because the body does not produce enough insulin. In Type 1 diabetes more than 90% of the insulin-producing cells of the pancreas are permanently destroyed. The pancreas produces little or no insulin. Most people who have Type 1 diabetes develop the disease before age 30. In Type 2 diabetes, the pancreas continues to produce insulin, sometimes even at higher than normal levels. However, the body develops resistance to the effects of insulin, so there is not enough insulin to meet the body's needs. Type 2 diabetes may occur in children and adolescents but usually begins in people older than 30 and becomes progressively more common with age.

Endocrine Disorders

Diagnoses: that frequently accompanied endocrine disorders were: 1) Hypertension (4019), 2) Unspecified acquired hypothyroidism (2449), 3) Hypopotassemia (2768), 4) Disorders of neurohypophysis (2536), 5) Tobacco use disorder (3051), 6) Malignant neoplasm of the thyroid gland (193), 7) Diabetes Mellitus II (25000), 8) Thyrotoxicosis (2424-9).

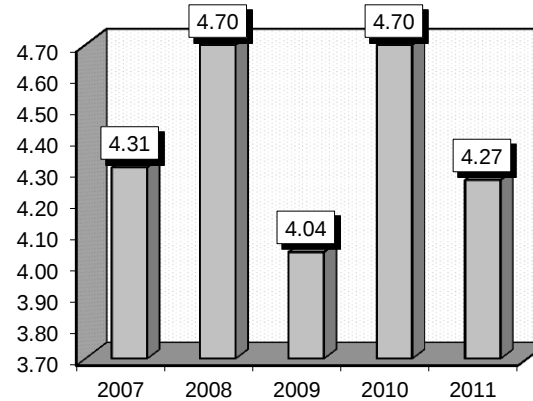

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hypothyroidism:** A condition in which the thyroid gland produces an insufficient amount of thyroid hormone. The resulting lowered metabolism interferes with the normal breakdown of "old" hormones and causes lethargy. **Hypopotassemia:** A deficiency of potassium. **Neurohypophysis:** Also known as the posterior lobe of the pituitary gland, it is composed of nervous tissue and is connected to the hypothalamus of the brain by the narrow stalk. **Malignant neoplasm:** Malignant tumor: a tumor that is malignant and tends to spread to other parts of the body. **Diabetes mellitus:** A group of disorders in which the body is unable to competently process blood sugars leading to hyperglycemia. This can lead to a host of ailments including poor circulation, kidney disorders and blindness. **Hyperglycemia:** A condition in which an excessive amount of glucose circulates in the blood plasma. **Thyrotoxicosis:** Another name for hyperthyroidism or high levels of thyroid hormone.

Kidney & Ureter Procedures For Neoplasm

Procedures: that frequently accompanied kidney & ureter procedures for neoplasm were: 1) Transfusion of packed cells (9904) 2) Closed [Percutaneous] [needle] biopsy of kidney (5523).

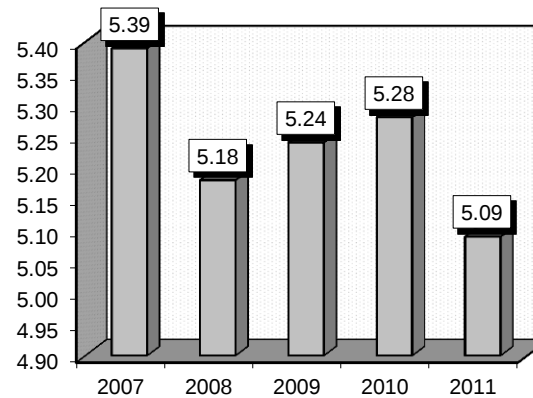

Definitions: **Ureter:** A tube through which the urine travels from the kidney to the bladder. **Neoplasm:** Tumor or abnormal cell growth that is either malignant or benign (non-cancerous). **Kidney:** Dual organs located in the lumbar area in which the primary function is to filter the blood removing waste in the form of urine. **Bladder, part unspecified:** Membrane sac that holds bodily fluids. **Secondary malignant neoplasm:** Cancerous tumor, or abnormal cell growth which has metastasized (transferred) from one part (or organ) of the body to another organ or part of the body. **Urinary organs:** A system of organs comprised of the kidneys, bladder, ureters, and the urethra which work together to remove urine from the body. **Transfusion:** The process of transferring blood from a donor to a recipient that is used to replenish lost blood. **Packed cells:** A concentration of blood cells that have been separated from plasma in order to treat severe anemia without also adding excess fluid into the blood stream. **Surgical removal of part or all of the synovial membrane.** **Closed needle biopsy:** The use of a syringe-like device to extract tissue samples for microscopic examination. **Percutaneous:** Through, or under, the skin.

Kidney And Ureter Procedures For Non-Neoplasm

Procedures: that frequently accompanied kidney and ureter procedures for non-neoplasm were: 1) Percutaneous nephrostomy (5503,4), 2) Ureteral catheterization (598), 3) Percutaneous pyelogram (8775), 4) Cystoscopy (5732), 5) Nephroureterectomy (5551), 6) Ureteroneoscystostomy (5674), 7) Correction of ureteropelvic junction (5587).

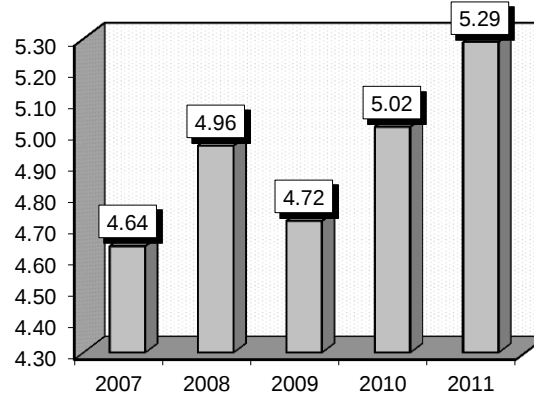

Definitions: **Percutaneous:** A procedure performed through a small opening made in the skin. **Percutaneous nephrostomy:** A method of draining an obstructed kidney by inserting a fine tube through the skin and into the collecting system of the kidney. **Catheterization:** Insertion of a slender tube through the urethra or through the anterior abdominal wall into the bladder, urinary reservoir, or urinary conduit. **Pyelogram:** An X ray of the kidneys and ureters. **Cystoscopy:** Examination of the bladder and urethra using a cystoscope, inserted into the urethra. A cystoscope is a thin, tube-like instrument with a light and a lens for viewing. **Nephroureterectomy:** Surgery to remove a kidney and its ureter. Also called ureteronephrectomy. **Ureteropelvic junction:** The anatomical location where the inside of the kidney connects to the ureter.

Prostatectomy

Procedures: that frequently accompanied prostatectomy were: 1) Transurethral excision or destruction of lesion or tissue of bladder (5749), 2) Cystoscopy (5732), 3) Transurethral clearance of bladder (570), 4) Transurethral (Ultrasound) guided laser induced prostatectomy (TULIP) (6021), 5) Retrograde pyelogram (8774), 6) Transurethral destruction of prostate tissue by other thermotherapy (6097), 7) Percutaneous cystostomy (5717), 8) Closed [percutaneous] [needle] biopsy of prostate (6011), 9) Removal of ureterostomy tube and ureteral catheter (9762).

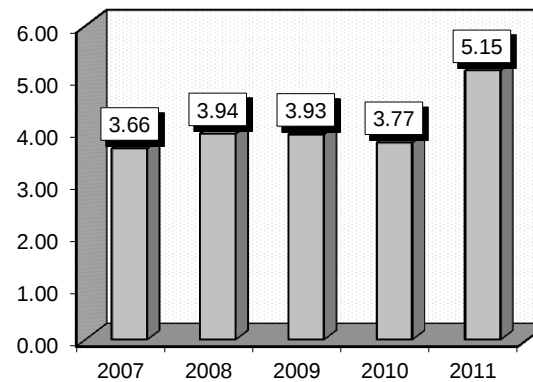

Definitions: Prostatectomy: A Prostatectomy is the surgical removal of all or part of the prostate gland. Abnormalities of the prostate, such as a tumour, or if the gland itself becomes enlarged for any reason, can restrict the normal flow of urine along the urethra. **Percutaneous:** A procedure performed through a small opening made in the skin. **Excision:** Removal by surgery. **Catheterization:** Insertion of a slender tube through the urethra or through the anterior abdominal wall into the bladder, urinary reservoir, or urinary conduit. **Pyelogram:** An X ray of the kidneys and ureters. **Cystoscopy:** Examination of the bladder and urethra using a cystoscope, inserted into the urethra. A cystoscope is a thin, tube-like instrument with a light and a lens for viewing. **Ureterostomy:** Surgical diversion of urine (usually temporarily) from the ureter(s) to outside the body by way of an opening or stoma on the abdomen.

Renal Failure

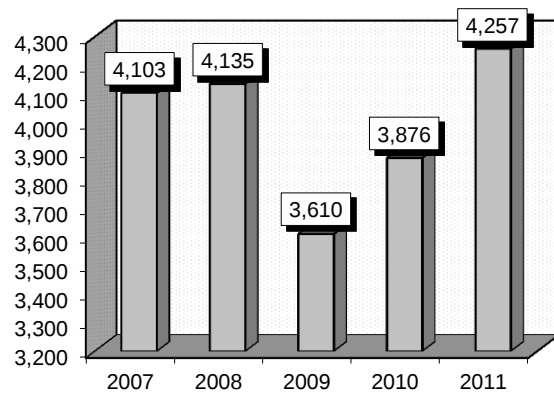

Diagnoses: that frequently accompanied renal failure were: 1) Unspecified hypertensive kidney disease (40391), 2) Congestive heart failure (4280), 3) Dehydration (27651), 4) Hypertension (4019), 5) Diabetes mellitus (25000).

Definitions: **Dehydration:** This can be caused by a lack of fluid intake, excessive urination possibly due to diuretics, diarrhea or vomiting. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Diabetes mellitus:** A group of disorders in which the body is unable to competently process blood sugars leading to hyperglycemia. This can lead to a host of ailments including poor circulation, kidney disorders and blindness. **Hyperglycemia:** A condition in which an excessive amount of glucose circulates in the blood plasma.

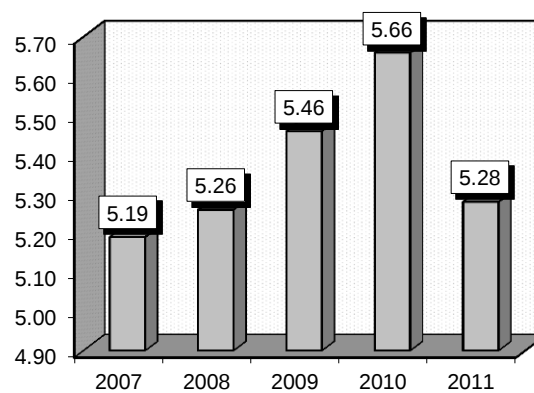

Comments: The kidneys are two fist-sized organs located on each side of the spine at the bottom of the rib cage and slightly above the waist. Renal failure is the inability of the kidneys to excrete wastes, concentrate urine and conserve electrolytes. The condition may be acute or chronic. In chronic kidney disease, the kidneys have not stopped working altogether but are not working as well as they should. Acute renal failure occurs when the kidneys stop working over a period of hours, days or in some cases, weeks. When acute renal failure occurs, wastes and excess waste products and excess water build up in the body which upsets the body's normal chemical balance. Substances that are normally needed for the body to function properly become poisonous to the body when they reach abnormally high levels.

Admit For Renal Dialysis

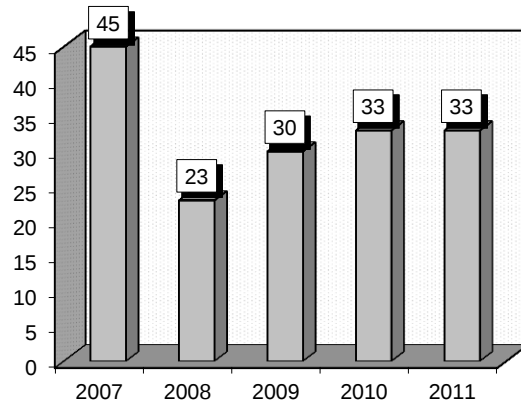

Diagnoses: that frequently accompanied admit for renal dialysis were: 1) Hemodialysis (3995), 2) Venous catheterization for renal dialysis (3895), 3) Total body perfusion (3996), 4) Transfusion of packed cells (9904).

Definitions: **Dialysis:** The process of filtering the blood when the kidneys are not able to cleanse it. **Hemodialysis:** Hemodialysis means "cleaning the blood." In hemodialysis, the blood is circulated through an artificial kidney machine, which contains a dialyzer (also called an artificial kidney). **Perfusion:** pumping of blood or artificial media through the blood vessels of an isolated organ for the purpose of nourishment. **Transfusion:** The introduction of whole blood or components of blood (such as plasma, platelets) from one person to another.

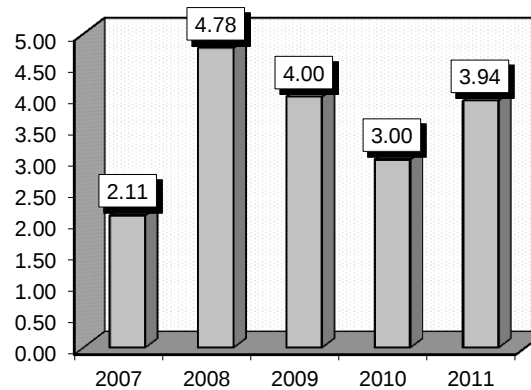

Comments: The kidneys are two fist-sized organs located on each side of the spine at the bottom of the rib cage and slightly above the waist. Renal failure is the inability of the kidneys to excrete wastes, concentrate urine and conserve electrolytes. The condition may be acute or chronic. In chronic kidney disease, the kidneys have not stopped working altogether but are not working as well as they should. Acute renal failure occurs when the kidneys stop working over a period of hours, days or in some cases, weeks. When acute renal failure occurs, wastes and excess waste products and excess water build up in the body which upsets the body's normal chemical balance. Substances that are normally needed for the body to function properly become poisonous to the body when they reach abnormally high levels.

Kidney & Urinary Tract Neoplasms

Diagnoses: that frequently accompanied kidney & urinary tract neoplasm were: 1) Malignant neoplasm of kidney, except pelvis (1890), 2) Malignant neoplasm of bladder, part unspecified (1889), 3) Secondary malignant neoplasm of other urinary organs (1981).

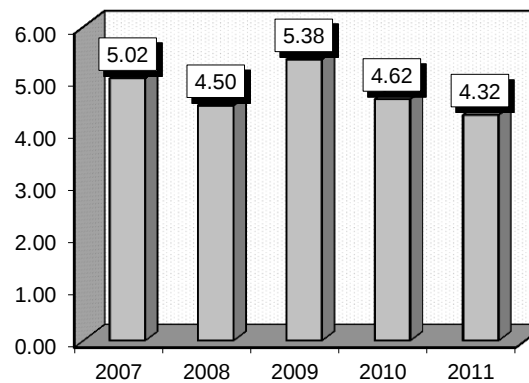

Definitions: **Malignant:** Generally refers to a cancerous tumor or mass that may or may not be localized in one part of the body. **Neoplasm:** Tumor or abnormal cell growth that is either malignant or benign (non-cancerous). **Kidney:** Dual organs located in the lumbar area in which the primary function is to filter the blood removing waste in the form of urine. **Bladder, part unspecified:** Membrane sac that holds bodily fluids. **Secondary malignant neoplasm:** Cancerous tumor, or abnormal cell growth which has metastasized (transferred) from one part (or organ) of the body to another organ or part of the body. **Urinary organs:** A system of organs comprised of the kidneys, bladder, ureters, and the urethra which work together to remove urine from the body. **Transfusion:** The process of transferring blood from a donor to a recipient that is used to replenish lost blood. **Packed cells:** A concentration of blood cells that have been separated from plasma in order to treat severe anemia without also adding excess fluid into the blood stream. Surgical removal of part or all of the synovial membrane. **Closed needle biopsy:** The use of a syringe-like device to extract tissue samples for microscopic examination. **Percutaneous:** Through, or under, the skin.

Kidney And Urinary Tract Infections

Diagnoses and Procedures: that frequently accompanied urinary kidney and urinary tract infections were: 1) Urinary tract infections, site not specified (5990), 2) Cystitis, unspecified (5959), 3) Pyelonephritis, unspecified (59080), Acute pyelonephritis without lesion of renal medullary necrosis (59010) 4) Acute cystitis (5950), 5) Acute pyelonephritis with lesion of renal medullary necrosis (59011),. 6) Urethral abscess (5970),

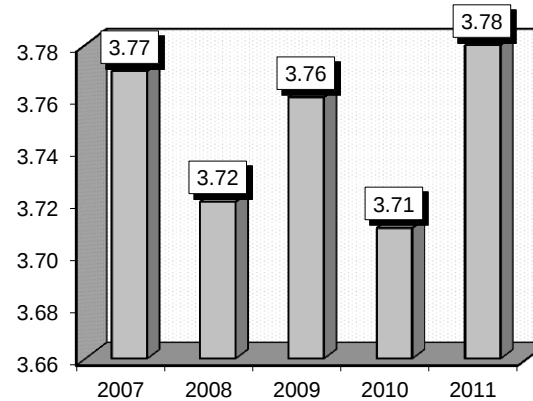

Definitions: **Urinary tract:** A series of interconnected organs which include the kidneys, bladder, and urethra that create and expel urine from the body. **Cystitis:** Urinary bladder inflammation commonly known as lower urinary tract infection or UTI. **Kidney:** Dual organs located in the lumbar area in which the primary function is to filter the blood removing waste in the form of urine. **Bladder, part unspecified:** Membrane sac that holds bodily fluids. **Urethra:** Tube-like canal connecting from the bladder to the outer urinary tract from which urine is expelled. **Pyelonephritis:** Inflammation of the kidney usually located in the upper urinary tract that is commonly caused by non-contagious UTI. **Acute:** Illness or disease with a rapid onset and severe symptoms, generally more serious than non-acute illnesses/disease. **Lesion:** Abnormal skin tissue that may result in a rash or from a wound. **Renal:** Having to do with the kidneys. **Medullary:** Commonly refers to glandular diseases such as those affecting the thyroid or lymph nodes. **Necrosis:** Localized tissue death normally due to injury or lack of oxygen to the affected area. **Abscess:** Septic (most common) and sterile (non-infectious in nature commonly found in injection sites or from drugs) tissue that is caused by the body's attempt to fight an infection. Inflammation, fever, chills, and redness at the site are symptoms of the body's attempt to fight germs by using white blood cells to create enzymes that digest the invading germs while also digesting tissue if left untreated.

Urinary Stones

Diagnoses and Procedures: that frequently accompanied urinary stones were: 1) Calculus of ureter (5921), 2) Calculus of kidney (5920), 3) Other calculus in bladder (5941), Calculus in urethra (5942) 4) Extracorporeal shockwave lithotripsy [ESWL] of the kidney, ureter and/or bladder (9851), 5) Ultrasonic fragmentation of urinary stones (5995), 6) Pyeloscopy (5522).

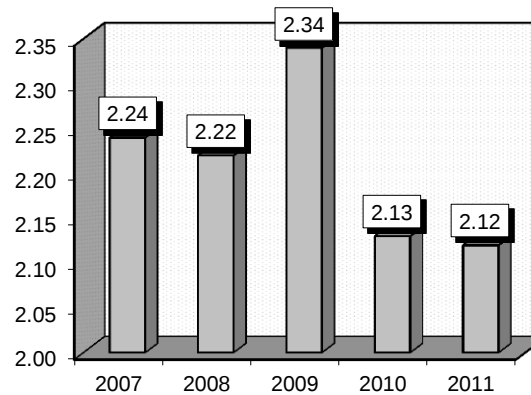

Definitions: **Calculus:** Stones formed from salt minerals and other organic material in the body such as mucous or blood. **Ureter:** Fibrous tube connected to each kidney that carries urine to the bladder. **Kidney:** Dual organs located in the lumbar area in which the primary function is to filter the blood removing waste in the form of urine. **Bladder:** Membrane sac that holds bodily fluids. **Urethra:** Tube-like canal connecting from the bladder to the outer urinary tract from which urine is expelled. **Extracorporeal shockwave lithotripsy [ESWL]:** The use of powerful sound waves, which causes vibrations, to break up gallbladder or kidney stones into smaller fragments so that they are removed from the body by passing urine. **Ultrasonic fragmentation:** Similar to ESWL where ultrasonic (sound waves frequencies so high the human ear cannot hear it) cause the stones to fragment into smaller pieces that are removed from the body by passing urine. **Pyeloscopy:** Fluoroscopic device used to observe calices (stones) in the kidney by using a contrast dye injected through the ureter.

Cesarean Section With Complications

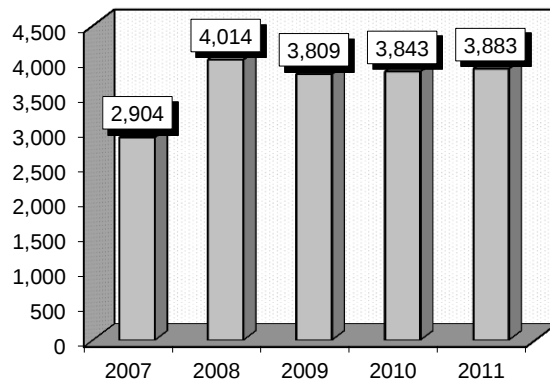

Procedures: that frequently accompanied cesarean section with complications were: 1) Bilateral tubal division (6632), 2) Medical induction of labor (734), 3) Peritoneal adhesiolysis (5459), 4) Vacuum extraction delivery (7279), 5) Bilateral tubal destruction (6639).

Definitions: **Antepartum:** Begins with conception and ends with the onset of labor. **Cesarean:** A surgical procedure in delivering the baby. Also called a C-section. An Epidural is given to block the pain, and an incision is made in the very low part of the woman's abdomen. The baby is removed through this incision after which it is sutured. **Fallopian tube:** One of a pair of ducts, one opening at one end into the uterus and the other end into the peritoneal cavity over the ovary. **Peritoneal:** A membrane that lines the wall of the abdominal cavity. **Adhesiolysis:** The treatment for the removal of scarlike tissue that forms between two surfaces within the body.

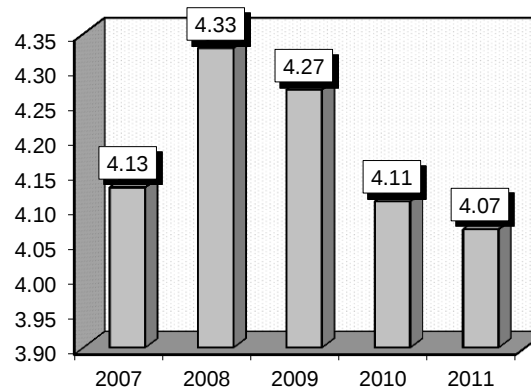

Comments: Common diagnoses associated with this procedure (listed in order of frequency) were: Mother had a previous cesarean delivery (65421), anemia (2859), abnormality in fetal heart rate or rhythm (65971), early onset of delivery (64421), advanced maternal age (65961), sterilization (V252).

Cesarean Section Without Complications

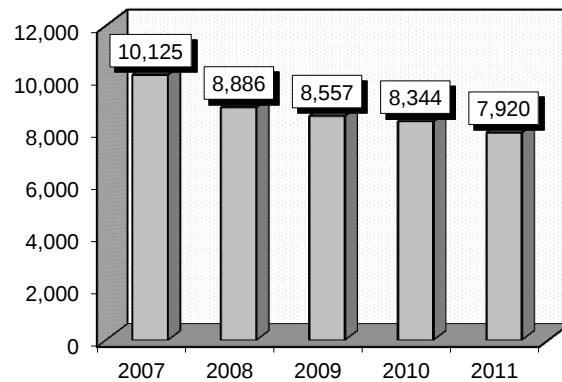

Procedures: that frequently accompanied cesarean section without complications were: 1) Bilateral tubal division (6632), 2) Medical induction of labor (734), 3) Bilateral tubal destruction (6639), 4) Vacuum extraction delivery (7279), 5) Peritoneal adhesiolysis (5459).

Definitions: **Antepartum:** Begins with conception and ends with the onset of labor. **Cesarean:** A surgical procedure in delivering the baby. Also called a C-section. An Epidural is given to block the pain, and an incision is made in the very low part of the woman's abdomen. The baby is removed through this incision after which it is sutured. **Fallopian tube:** One of a pair of ducts, one opening at one end into the uterus and the other end into the peritoneal cavity over the ovary. **Peritoneal:** A membrane that lines the wall of the abdominal cavity. **Adhesiolysis:** The treatment for the removal of scarlike tissue that forms between two surfaces within the body.

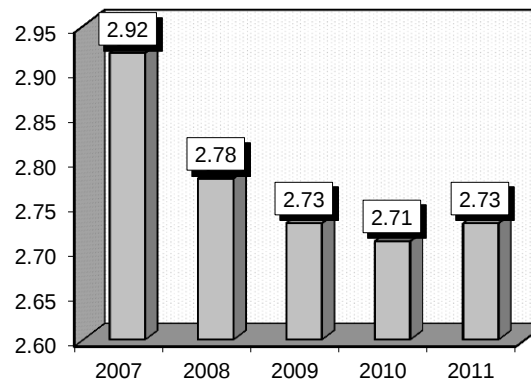

Comments: Common diagnoses associated with this procedure (listed in order of frequency) were: Mother had a previous cesarean delivery (65421), abnormality in fetal heart rate or rhythm (65971), sterilization (V252), cord entanglement (66331), elderly with previous pregnancy (65961), early onset delivery (64421), breach delivery (65221).

Vaginal Delivery Without Complicating Diagnoses

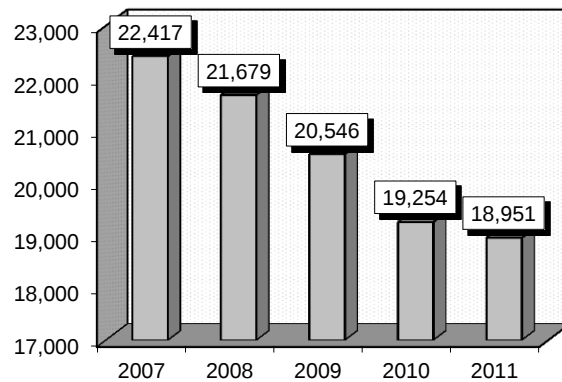

Procedures: that frequently accompanied vaginal delivery without complicating diagnoses were: 1) Repair of obstetric laceration (7569), 2) Medical induction of labor (734), 3) Artificial rupture of membranes (7309), 4) Episiotomy (736), 5) Vacuum extraction delivery (7279).

Definitions: **Antepartum:** Begins with conception and ends with the onset of labor. **Vaginal delivery:** The birth of a fetus through the vagina. **Laceration:** The medical word for cut or tear of the skin or tissue. **Episiotomy:** A small incision of the perineum made to enlarge the vaginal opening. **Perineum:** The muscle and tissue between the vagina and the rectum.

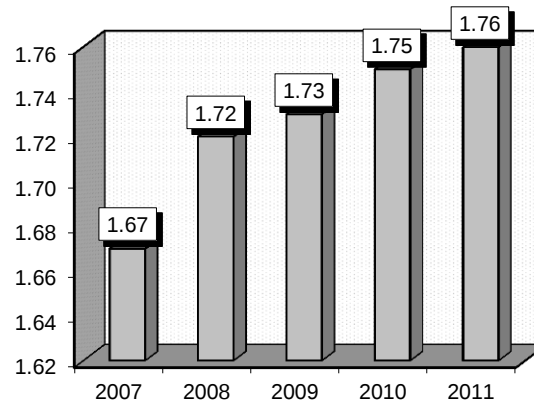

Comments: Diagnoses included in this procedure include, but are not limited to, normal delivery, drug dependence-delivered, twin pregnancy-delivered, premature rupture of membranes-delivered, breech presentation-delivered, maternal stress-delivered, and cord prolapse-delivered. Common diagnoses associated with this DRG (listed in order of frequency) are: Perineal laceration, rupture, or tear involving: fourchette, hymen, labia, skin, vagina, vulva, pelvic floor, perineal muscles, vaginal muscles, (66401, 4, 11), cord entanglement (66331), pregnancy over 40 completed weeks to 42 completed weeks gestation (6451).

Prematurity With Major Problems

Diagnoses and Procedures: that frequently accompanied prematurity with major problems were: 1) Single liveborn, born in hospital, delivered by cesarean section (V3001), 2) Single liveborn, born in hospital, delivered without mention of cesarean section (V3000), 3) Twin birth, mate liveborn, born in hospital, delivered by cesarean section (V3101), Twin birth, mate liveborn, born in hospital, delivered without mention of cesarean section (V3100) 4) Ultraviolet light therapy (9982), 5) Parenteral infusion of concentrated nutritional substances (9915), 6) Insertion of endotracheal tube (9604) .

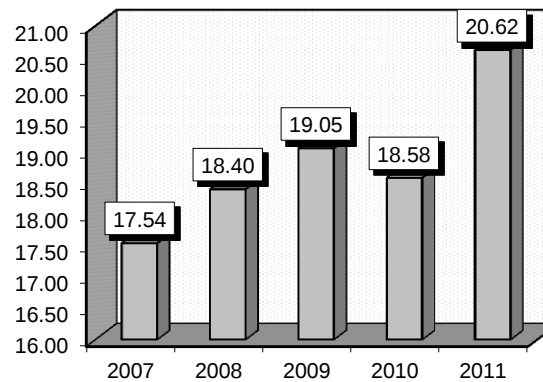

Definitions: **Liveborn:** An infant that shows signs of life. Opposite of stillborn. **Cesarean section:** A form of delivery where an incision is made in the abdomen to remove the baby from the mother's uterus. **Twin birth:** A case where two identical (coming from one fertilized egg) or fraternal (separate fertilized eggs) infants born from the same pregnancy. **Ultraviolet light therapy:** Used primarily in treating the skin by focusing an invisible light spectrum over the affected area. **Infusion:** A procedure where fluid containing nutrients or electrolytes are administered into the bloodstream either intravenously or through injection. . **Endotracheal Tube:** A catheter that is inserted into the trachea through the mouth or nose. Its purpose is to provide oxygen or to clear away mucus..

Normal Newborn

Procedures: that frequently accompanied normal newborn were: 1) Vaccination (9955), 2) Audiometry (9541), 3) Neurological function test (8915), 4) Circumcision (640), 5) Hearing examination (9547).

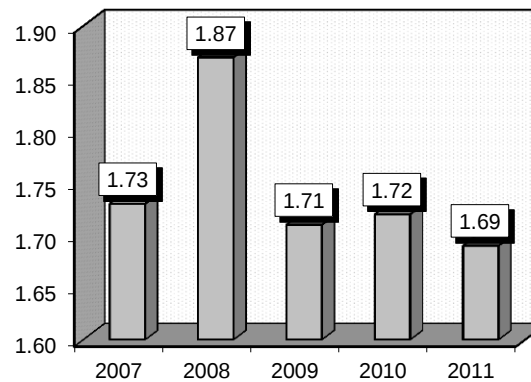

Comments: On average, birth weights range from five pounds five ounces to eight pounds. The pulse of a newborn ranges from 100 to 170 beats per minute when awake, 70 to 80 when sleeping deeply. They take an average of 30 to 50 breaths per minute. Nearly all fair-skinned babies are born with blue or gray eyes, which may gradually change color over the first 12 months. Darker-skinned babies most often are born with brown or darker eyes, which usually stay that color. Dark-haired babies usually stay that way, but blond hair often darkens with age. Newborn babies have a soft spot, also known as the fontanel, that is diamond shaped just above the hairline, where the baby's skull bones have not yet fused together.

Postoperative Or Post-Traumatic Infections

Diagnoses and Procedures: that frequently accompanied post-operative or post traumatic infections were: 1) Other postoperative infection (99859), 2) Infected postoperative seroma (99851), 3) Infection following other infusion, injection, transfusion, or vaccination (99939), 4) Venous catheterization, not elsewhere classified (3893) 4) Percutaneous abdominal drainage (5491), 5) Other incision with drainage of skin and subcutaneous tissue (8604), 6) Excisional debridement of wound, infection, or burn (8662).

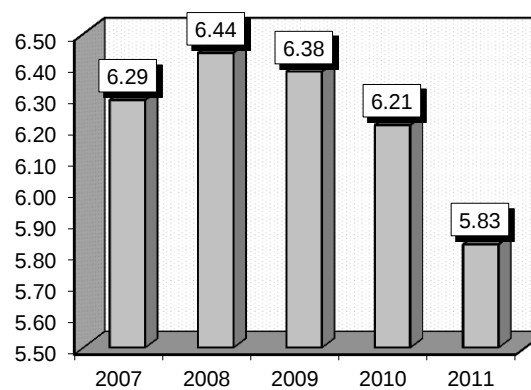

Definitions: **Postoperative:** Time period between the end of an operation and when the affects of anesthesia wear off. **Infection:** A condition where bacteria or a foreign article is introduced to the body via airborne or from a wound that has the capacity to cause tissue damage. **Seroma:** Caused by the accumulation of serum which hardens into a tumor-like mass. **Infusion:** A procedure where fluid containing nutrients or electrolytes are administered into the bloodstream either intravenously or through injection. **Transfusion:** A procedure where either whole blood or blood by-products are administered to the body by intravenous fluid. **Venous catheterization:** A part of the circulatory system that carries blood back to the heart. Catheterization involves placing a flexible tube into the body in order to put fluid in or remove fluid from the body. **Percutaneous:** Through, or under, the skin. **Subcutaneous:** Under the skin. **Excise:** Cutting away from the body. **Debridement:** Removing damaged tissue in order to speed up recovery.

Viral Illness

Diagnoses and Procedures: that frequently accompanied viral illness were: 1) Unspecified viral infection (7999), 2) Infectious mononucleosis (75), 3) Herpes zoster with other specified complications (5379), 4) Spinal Tap (331), 4) Venous catheterization, not elsewhere classified (3893), 5) Hemodialysis (3995), 6) Transfusion of packed cells (9904).

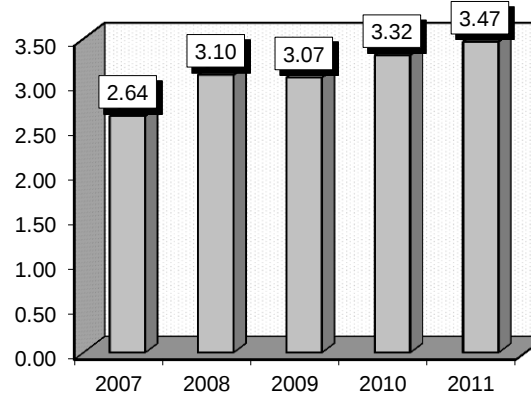

Definitions: **Viral:** virus - a minute infectious particle comprised of nucleic acid, DNA or RNA (but not both).. **Infection:** A condition where bacteria or a foreign article is introduced to the body via airborne or from a wound that has the capacity to cause tissue damage. **Mononucleosis:** Infectious disease caused by the accumulation of abnormally large white blood cells. **Herpes Zoster:** An acute inflammatory disease affecting the cerebral ganglia (encapsulated joint), ganglia of the posterior nerve roots and peripheral nerve roots. **Spinal Tap:** A medical procedure in which a needle is inserted into the lumbar (lower) region of the spinal cord and cerebrospinal fluid is extracted. The fluid is subsequently examined for the presence of disease. **Venous catheterization:** A part of the circulatory system that carries blood back to the heart. Catheterization involves placing a flexible tube into the body in order to put fluid in or remove fluid from the body. **Hemodialysis:** A procedure where the blood is cleansed from toxic substances by using a machine (dialyzer) connected to the arteries from either a shunt or fistula. **Packed cells:** A concentration of blood cells that have been separated from plasma in order to treat severe anemia without also adding excess fluid into the blood stream. Surgical removal of part or all of the synovial membrane.

Septicemia Or Severe Sepsis

Diagnoses and Procedures: that frequently accompanied septicemia or severe sepsis were: 1) Unspecified septicemia (389), 2) Bacteremia (7907), 3) Septicemia due to *Escherichia coli* [E. coli] (3842), 4) Other septicemia due to gram-negative organisms (3849), 4) Streptococcal septicemia (380), 5) Methicillin resistant *Staphylococcus aureus* septicemia (3812),

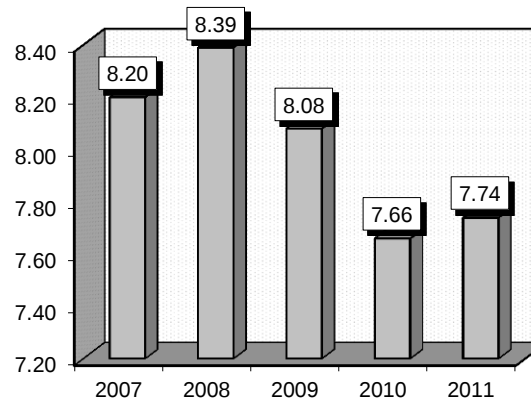

Definitions: **Septicemia:** Blood poisoning or systemic disease caused by pathogenic microorganisms infecting the blood. **Bacteremia:** Bacteria in the bloodstream. **Escherichia coli [E. coli]:** Bacteria normally found in the human or animal digestive tract. **Gram negative:** A bacterium that decolorizes in alcohol. **Streptococcal:** An organism that causes infection of the skin and other diseases. **Methicillin resistant staphylococcus auarus [MRSA]:** An organism that is highly resistant to antibiotics.

Depressive Neuroses

Diagnoses: that frequently accompanied depressive neuroses were: 1) Hypertension (4019), 2) Suicidal ideation (V6284), 3) Dysthymic disorder (3004), 4) Tobacco use disorder (3051), 5) Hyperlipidemia (2724), 6) Chronic airway obstruction (496), 7) Hypopotassemia (2768).

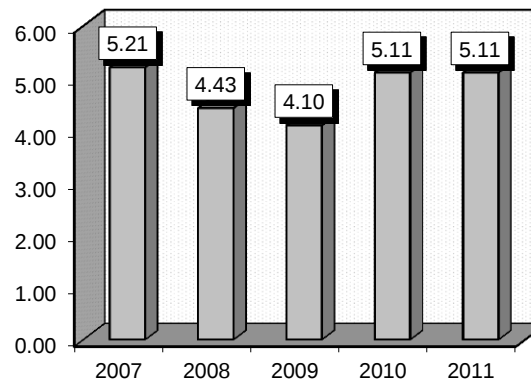

Definitions: **Depression:** A mental state characterized by a pessimistic sense of inadequacy and a despondent lack of activity. **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Dysthymic disorder:** A chronic, yet mild, form of depression; it is more prevalent and long-lasting than major depression and is associated with a significant disability in physical, social and role functioning, high healthcare utilization and poor quality of life. **Hyperlipidemia:** Excess levels of fats in the blood. These fats can be triglycerides, or cholesterol. Hyperlipidemia is often associated with increased risk of heart disease and strokes. There are genetic disorders that predispose to hyperlipidemia. **Hypopotassemia:** Disorder of fluid, electrolyte, and acid-base balance.

Alcohol/Drug Abuse Or Dependence

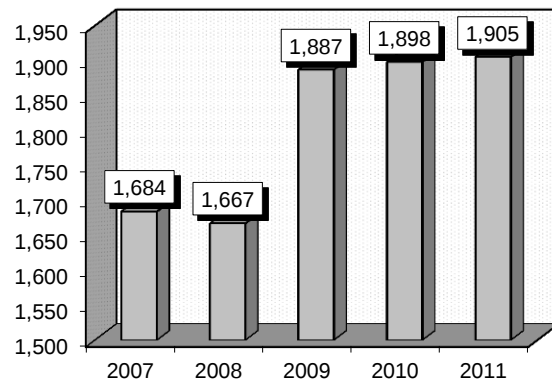

Diagnoses: that frequently accompanied alcohol and drug abuse or dependence were: 1) Tobacco use disorder (3051), 2) Hypertension (4019), 3) Alcohol withdrawal (29181), 4) Convulsions (78039), 5) Hypopotassemia (2768), 6) Opioid type dependence; continuous use (30401), 7) Alcohol withdrawal (29181), 8) Drug withdrawal (2920).

Definitions: **Hypertension:** Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Hypopotassemia:** Disorder of fluid, electrolyte, and acid-base balance. **Depression:** An abnormal emotional state characterized by exaggerated feelings of sadness, dejection, worthlessness, and hopelessness that are out of proportion to reality.

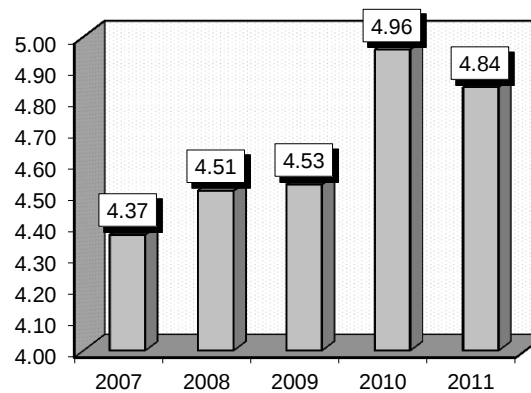

Comments: Alcohol and drug withdrawal symptoms vary from person to person. They will normally include one or more of the following: Severe headache, shakiness, hand tremors, anxiety, mood swings, depression, difficulty sleeping, nightmares, nausea, heart palpitations and loss of consciousness.

Poisoning & Toxic Effects Of Drugs

Diagnoses: that frequently accompanied poisoning and the toxic effects of drugs were: 1) Tobacco abuse disorder (3051), 2) Acute respiratory failure (51881), 3) Hypertension (4019), 4) Poisoning by psychotropic agents (969), 5) Depressive disorder (311), 6) Hypopotassemia (2768), 7) Bipolar disorder (2964-7), 8) Nondependent alcohol abuse (3050), 9) Altered mental status (78097).

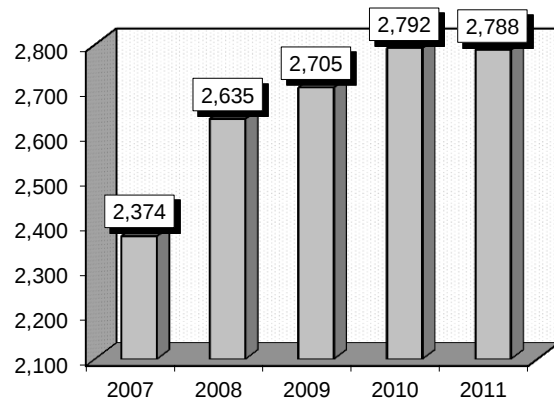

Definitions: Hypertension: Elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause.

Psychotropic: A drug that affects the mind, emotions, or behavior. **Hypopotassemia:** Disorder of fluid, electrolyte, and acid-base balance. **Bipolar disorder:** Previously referred to as manic depressive illness, characterized by the occurrence of mania (euphoria) alternating with bouts of depression.

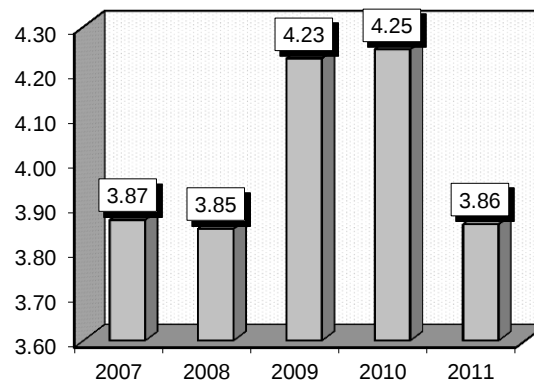

Comments: Poisoning is a condition produced by the ingestion of, injection of, inhalation of, or exposure to a poisonous substance. According to the Center for Disease Control and Prevention, a poisoning is a poison exposure that results in bodily harm. Poison exposures can occur by accident without intent, these exposures are defined as unintentional poisonings. Poison exposures can be the result of a conscious, willful decision, defined as intentional poisonings. Identification of the poison and presentation of a container label are critical to diagnosis and treatment.
